1. **Identify the problem.** The first step is to identify the problem. This involves understanding the symptoms and the context in which they are occurring.

2. **Define the problem.** Once the problem is identified, it needs to be defined in terms of its scope and impact. This helps to clarify what is being addressed.

3. **Generate hypotheses.** Next, several hypotheses are generated to explain the problem. These are based on the information gathered in the first two steps.

4. **Test the hypotheses.** Each hypothesis is then tested through observation or experimentation. This step is crucial for determining which hypothesis is most likely correct.

5. **Draw conclusions.** Based on the results of the tests, conclusions are drawn about the cause of the problem.

6. **Implement solutions.** Finally, solutions are implemented based on the conclusions. This step involves putting the findings into practice.

7. **Evaluate the results.** The last step is to evaluate the results of the solutions. This helps to determine if the problem has been effectively resolved.
