Core Biopsies, Low Power

Infiltrating Ductal Carcinoma

Focal Gland Formation

CLINICAL HISTORY: palpable right breast mass; calcifications on mammogram

SITES: right breast core biopsies

GROSS: Received in formalin are 4 cores of white and yellow tissue, each measuring 2.0 X .03 cm in diameter. Totally embedded in one cassette. MS/ad

MICROSCOPIC: Sections reveal infiltrating ductal carcinoma. The tumor is composed of irregular, nests and cords of cells with focal gland formation. Individual cells have irregular nuclei and nucleoli. Well formed glands make up less than 20% of the tumor. Mitoses are occasionally encountered and these number 4 per 10 hpf. The tumor elicits a desmoplastic stromal reaction. Calcifications are seen within a few neoplastic ducts as well as the stroma. There is a focus of ductal carcinoma in situ involving one core. Nuclei are large and have prominent nucleoli. The duct lumen is filled with necrotic debris. All four core biopsies contain infiltrating carcinoma; the longest tumor segment is 1.7 cm in a 2 cm core.

Breast Marker analysis is pending and an addendum report will be issued.
