

Illustration 9-14 - Checking and adjusting the clutch and floor shift

Illustration 9-15 - Gear cluster seen from the rear

To adjust spring tension:

1. Fit the collector fork shaft into the hole in the camplate.
2. Fit a collector fork onto it.
3. Fit the spring assembly. Push the fork lightly to the centre.

The aim is to adjust the position of the spring when the selector is in the centre fork, such that there is minimal clearance between the edge of the spring and the collector fork and vertically, so that the push of the spring is to line with the collector fork when the spring is depressed as it will be when the cam plate pushes against it. Measure the spring with a finger to give you the check. When operated with the spring position, up or the centre and check up the adjustment.

Fitting the (new) gear change spring (Illustration 9-16 and 9-17)

When fitted to the gear change shaft, a new spring should sit straight and be free, and should connect in line with the shaft and be horizontal. It should be in line with the shaft.

How hard to actually fit and measure this spring? There is a lot of a little to it. The part of the shaft and push on it - hard to describe, but it helps to get a wire through the hole in the shaft to check the position.

There should also be no gap in the adjustment for the spring and the cam in the spring. If you are not happy with the fit of your new spring, take it back to the vendor and compare it with the quality of pattern parts there.
