Shapiro, Dennis Shasha, 1999-10-28 Finding patterns in biomolecular data particularly in DNA and RNA is at the center of modern biological research. These data are complex and growing rapidly so the search for patterns requires increasingly sophisticated computer methods. *Pattern Discovery in Biomolecular Data* provides a clear up-to-date summary of the principal techniques. Each chapter is self-contained and the techniques are drawn from many fields including graph theory, information theory, statistics, genetic algorithms, computer visualization, and vision. Since pattern searches often benefit from multiple approaches, the book presents methods in their purest form so that readers can best choose the method or combination that fits their needs. The chapters focus on finding patterns in DNA, RNA, and protein sequences; finding patterns in 2D and 3D structures; and choosing system components. This volume will be invaluable for all workers in genomics and genetic analysis and others whose research requires biocomputing.

Mitosis and Meiosis, 1998-12-16 *Mitosis and Meiosis* details the wide variety of methods currently used to study how cells divide as yeast and insect spermatocytes, higher plants, and sea urchin zygotes. With chapters covering micromanipulation of chromosomes and making, expressing, and imaging GFP fusion proteins, this volume contains state-of-the-art secrets that allow researchers to obtain novel information on the biology of centrosomes and kinetochores and how these organelles interact to form the spindle. Chapters contain information on how to generate screen and study mutants of mitosis in yeast, fungi, and flies; techniques to best image fluorescent and nonfluorescent tagged dividing cells; the use and action of mitoclastic drugs; how to generate antibodies to mitotic components and inject them into cells; methods that can also be used to obtain information on cellular processes in nondividing cells.
