

## 21.1 Plant Evolution and Adaptations

- When scientists compare present-day plants and present-day green algae, they find the following common characteristics:
  - cell walls composed of cellulose
  - cell division that includes the formation of a cell plate
  - the same type of chlorophyll used in photosynthesis
  - similar genes for ribosomal RNA
  - food stored as starch
  - the same types of enzymes in cellular vesicles

**The Produce Contamination Problem** Karl Matthews, 2014-02-15 Understanding the causes and contributing factors leading to outbreaks of food borne illness associated with contamination of fresh produce is a worldwide challenge for everyone from the growers of fresh cut produce through the entire production and delivery process The premise of The Produce Contamination Problem is that when human pathogen contamination of fresh produce occurs it is extremely difficult to reduce pathogen levels sufficiently to assure microbiological safety with the currently available technologies A wiser strategy would be to avoid crop production conditions that result in microbial contamination to start These critical problem oriented chapters have been written by researchers active in the areas of food safety and microbial contamination during production harvesting packing and fresh cut processing of horticultural crops and were designed to provide methods of contamination avoidance Coverage includes policy and practices in the United States Mexico and Central America Europe and Japan Addresses food borne contaminations from a prevention view providing proactive solutions to the problems Covers core sources of contamination and methods for identifying those sources Includes best practice and regulatory information

*Plant Microbiome: Stress Response* Dilfuza Egamberdieva, Parvaiz Ahmad, 2018-02-06 This book presents state of the art research on the many facets of the plant microbiome including diversity ecology physiology and genomics as well as molecular mechanisms of plant microbe interactions Topics considered include the importance of microbial secondary metabolites in stimulating plant growth induced systemic resistance tolerance to abiotic stress and biological control of plant pathogens The respective contributions show how microbes help plants to cope with abiotic stresses and represent significant progress toward understanding the complex regulatory networks critical to host microbe interaction and plant adaptation in extreme environments New insights into the mechanisms of microbial actions in inducing plant stress tolerance open new doors for improving the efficacy of microbial strategies and could produce new ways of economically increasing crop yields without harming the environment As such this book offers an essential resource for students and researchers with an interest in plant microbe interaction as well as several possibilities for employing the plant microbiome in the enhancement of crop productivity under future climate change scenarios

*Acid Mine Drainage and its Governance in the Gauteng City-Region* Kerry Bobbins, 2015-05-29 Acid mine drainage AMD has generated an enormous amount of media interest and public concern in the Gauteng City Region GCR over the last decade However it has been framed as a narrow technical concern with government action being directed towards securing the necessary engineering and processing solutions as quickly as possible to prevent decant and treat acid mine water to industrial standards This has arguably limited the scope for full discussion and debate on the impacts of AMD particularly for the environment and this bears implications for how AMD has been managed in the GCR Government s immediate short and long term interventions to address AMD

have been set out as a straight forward solution but over time more complex environmental concerns have emerged. Becoming more evident over the last few years is that one of the main impacts of AMD will be its effect on the overall water security in the Vaal River System VRS on which the GCR relies for its supply of potable water. Limits on water abstraction from the VRS together with the increasing need to maintain the overall water quality in the system through dilution and treatment activities means that AMD is beginning to manifest as a binding constraint on economic development and a burden on society in particular via escalating costs for water consumers. Fiscal constraints are likely to see GCR residents and businesses pick up more and more of the costs associated with the treatment of AMD through the format of increased municipal tariffs. With final decisions on municipal tariffs now pending the broader yet invisible impacts of AMD loom large. This means that the debate has moved far beyond the issue of predicted decant in each of the Witwatersrand's mining basins. Water security for the GCR and who will carry the costs associated with the long term treatment of AMD have instead taken centre stage. This paper carefully updates the historical record on AMD since the publishing of a GCRO Provocation on the issue in 2010. In doing so it argues that the way in which AMD has been governed raises a flag around how the political economy of an issue such as AMD should be understood publicly debated and managed. In particular it suggests that the governance of an environmental challenge such as AMD is not only about finding a technical solution. The lack of platforms to ensure well informed public deliberation especially over such issues as who will pay and how must be addressed to ensure more equitable and transparent decision making. In light of the broader mine waste legacy inherited by the GCR and the strong likelihood of environmental contamination becoming more commonplace in the future these concerns are not only limited to AMD. They will only grow in importance over time.

**Understanding the Molecular Mechanisms of Plant Responses to Abiotic Stress** Sang Yeol Lee, Dae-Jin Yun, Jose M. Pardo, Motoaki Seki, Yan Guo, Abel Rosado, 2020-02-20. Plant responses to environmental stress are governed by complex molecular and biochemical signal transduction processes which act in coordination to determine tolerance or sensitivity at the whole plant level. Upon

exposure to abiotic stress plants express a sophisticated coordinated response to reprogram interconnected defense networks and metabolic pathways by alterations in the transcription translation and post translational modification of defense related genes and proteins Traditionally physiological and phenotypic responses were the major ones to be collected in plant stress biology However modern studies include the identification of key genes that influence stress tolerance and plant growth under the imposing stress and the verification of gene functions using knock out mutants or overexpression lines In addition genomics has become a necessary tool for the understanding of plant stress responses at the whole genome levels The identification of stress tolerant plant resources and the investigation of the functional role of the genetic variants is also a valuable tool in this research field Recently the advent of CRISPR Cas genome editing technology enables these variations to be introduced in crops for improved stress tolerance traits Through the understanding of the molecular mechanisms involved in plant signaling in response to abiotic stress and crop performance characters under stress conditions we hope to open new ways for the breeding of superior crops

*Biology* Burton S. Guttman, Johns W. Diversity and Eco-Physiological Responses of Aquatic Plants Chunhua Liu, Sidinei Magela Thomaz, ZhongQiang Li, Te CAO, Katya E. Kovalenko, 2020-06-16 Aquatic plants refer to a diverse group of aquatic photosynthetic organisms large enough to be seen with the naked eye and the vegetative parts of which actively grow either permanently or periodically for at least several weeks each year submerged below floating on or growing up through the water surface These include aquatic vascular plants aquatic mosses and some larger algae Aquatic plants are grouped into life forms each of which relates differently to limiting factors and has distinct ecological functions in aquatic ecosystems Life form groups include emergent macrophytes plants that are rooted in sediment or soils that are periodically inundated with all other structures extending into the air floating leaved macrophytes rooted plants with leaves that float on the water surface submersed macrophytes rooted plants growing completely submerged free submerged macrophytes which are not rooted but attached to other macrophytes or submerged structures and free floating macrophytes plants that float on the water surface Aquatic plants play an important role in the structure and function of aquatic ecosystems by altering water movement regimes providing shelter and refuge and serving as a food source In addition aquatic plants produce large standing crops which can also stabilize sediments accumulate large amounts of nutrients thus improving water healthy Thus because of their ecological role aquatic plants are an important component of aquatic ecosystems Aquatic plants are very vulnerable to human activities and global changes and many species of the plants had become endangered in the past several decades due to habitat loss flooding damming over foraging biological invasion and eutrophication which might not be halted but enforced in the future
