

- Suppose two molecules that can react collide. What **3** circumstances need to occur for the molecules to react?
1. There must be enough energy, 2. They must collide, 3. They must have the correct orientation
- What does the **activation energy** for a chemical reaction mean?
This is the amount of energy required to make the molecules collide so that a reaction may occur.
- What role does the **reactivity of the reactants** play in determining the rate of a chemical reaction?
If reactants are not reactive, the reaction may not occur.
- Using the **collision theory**, explain why sugar sprinkled over a Bunsen burner reacts more quickly than a **chunk** of the same solid.
When the sugar is broken up into individual crystals, there is more surface area and more molecules available to collide and react.
- Use the **collision theory** to explain why **increasing the concentration** of a reactant usually increases the reaction rate.
Increasing the concentration increases the number of molecules which increases the likelihood that collisions will occur.
- Use the **collision theory** to explain why **increasing the temperature** usually increases the reaction rate.
Increasing the temperature increases the speed of the molecules. Faster moving molecules collide more.
- Explain how a **catalyst** affects the activation energy for a chemical reaction.
A catalyst ensure that molecules will collide in the correct orientation, so less energy is needed.
- On** the accompanying energy diagram, label the following items:
 - reactants **A**
 - products **D**
 - activation energy **B**
- Draw and label** what this diagram would look like if a **catalyst** was added to the reaction.
- Graph reading
 - How much energy do the reactants have?
20 kJ
 - How much energy do the products have?
35 kJ
 - How much energy is required to activate this un-catalyzed reaction?
Approximately 25 kJ.
 - Will this reaction need to absorb energy or will it release energy to the environment? How do you know?
It will absorb energy because the products have more energy than the reactants.

Chemical Principles William L. Masterton, Emil J. Slowinski, Conrad L. Stanitski, 1981 Modern Electrochemistry 2A John O'M. Bockris, Amulya K.N. Reddy, Maria E. Gamboa-Aldeco, 2007-05-08 This book had its nucleus in some lectures given by one of us J O M B in a course on electrochemistry to students of energy conversion at the University of Pennsylvania It was there that he met a number of people trained in chemistry physics biology metallurgy and materials science all of whom wanted to know something about electrochemistry The concept of writing a book about electrochemistry which could be understood by people with very varied backgrounds was thereby engendered The lectures were recorded and written up by Dr Klaus Muller as a 293 page manuscript At a later stage A K N R joined the effort it was decided to make a fresh start and to write a much more comprehensive text Of methods for direct energy conversion the electrochemical one is the most advanced and seems the most likely to become of considerable practical importance Thus conversion to electrochemically powered transportation systems appears to be an important step by means of which the difficulties of air pollution and the effects of an increasing concentration in the atmosphere of carbon dioxide may be met Corrosion is recognized as having an electrochemical basis The synthesis of nylon now contains an important electrochemical stage Some central biological mechanisms have been shown to take place by means of electrochemical reactions A number of American organizations have recently recommended greatly increased activity in training and research in electrochemistry at universities in the United States

Journal of Research of the National Bureau of Standards United States. National Bureau of Standards, 1977 The Future of Post-Human Chemistry Peter Baofu, 2011-08-08 Is chemistry really so valuable that as Theodore L Brown 2011 and his colleagues continue to claim in the twelfth edition of their work in 2011 chemistry is the central science in connecting the physical sciences with the life

and applied sciences WK 2011 C Reinhardt 2001 This crowning of chemistry however can be contrasted with an opposing view as Michael Polanyi once questioned the centrality of chemistry when he wrote that no inanimate object is ever fully determined by the laws of chemistry so other fields of study are just as important BQ 2011 Contrary to these conflicting views about chemistry and other ones discussed in the book chemistry in relation to substances and their changes is neither possible nor desirable to the extent that the respective ideologues on different sides would like us to believe This challenge to the conflicting views about chemistry does not mean however that chemistry is useless or that those fields of study related to chemistry like astronomy physics geology mathematics material science biology psychology computer science and so on should be ignored too Of course neither of these extreme views is reasonable Instead this book provides an alternative better way of understanding the future of chemistry especially in the dialectic context of substances and their changes while learning from different approaches in literature but without favoring any one of them or integrating them since they are not necessarily compatible with each other This book offers a new theory that is the creational theory of chemistry to go beyond the existing approaches to literature in an original way If successful this seminal project will fundamentally change the way that we think about chemistry from the combined perspectives of the mind nature society and culture with enormous implications for the human future and what the author originally called its post human fate
