Radiochemical Methods in Analysis D. Coomber, 2012-12-06 The aim of this book is to give an account of the principal radiochemical methods used in chemical analysis. It is assumed that the reader already has some background knowledge of radioactivity available from several general textbooks. For this reason some subjects e.g. the fundamentals of radioactivity, the properties of radiation, statistics of counting procedures, the precautions needed in working with radioactive materials which could have occupied half the text are not considered in detail. The different aspects of radiochemical analysis have been covered by specialized books and reviews e.g. on activation analysis, gamma spectrometry, radiometric titrations. A good deal of information is in the form of reports of meetings and symposia and liquid scintillation counting for instance has been mainly covered in this way. There are also a large number of journals. It is therefore hoped that this book will help fill the gap between the introductory texts and the specialized sources many of which are referred to in the chapter references. The first three chapters in the present volume deal with the methods of measurement of radioactive nuclides. Chapter I gives a general account of detection and measurement techniques. The next two chapters are devoted to two specialized techniques, gamma ray spectrometry and liquid scintillation counting. *Prentice Hall Physical Science Concepts in Action Program Planner National Chemistry Physics Earth Science*, 2003-11 Prentice Hall Physical Science Concepts in Action helps students make the important connection between the science they read and what they experience every day. Relevant content, lively explorations and a wealth of hands-on activities take students' understanding of science beyond the page and into the world around them. Now includes even more technology tools and activities to support differentiated instruction. *Bioanalytical Techniques* Sekhar Talluri, 2012-06-06 This book describes the principles of the bioanalytical techniques that are used in clinical diagnosis, pharmaceutical analysis, bioprocess monitoring, environmental studies and life sciences research. The primary focus of this book is on instrumental methods which are evolving rapidly due to the availability of new technologies. The basic concepts of each technique are explained in as concise and simple a manner as possible without sacrificing generality or rigour. Part I and Part II are primarily for undergraduate students. Part I describes analytical methods that are based on the separation of particles: chromatography, electrophoresis, mass spectrometry etc. Part II describes methods based on spectroscopy, scattering and diffraction. Part III introduces some basic biochemical and molecular biological methods such as binding assays, PCR, protein sequencing and nucleic acid sequencing and is intended as background material for students who are interested in the topics described in Part IV. Part IV describes the basic concepts of novel micro and nano bioanalytical techniques which are based on biosensors, microarrays, microfluidics, surface plasmon resonance and nanomaterials. Part IV is primarily for postgraduate students. However, adequate basics are provided to ensure that advanced
