Müller-Vahl,2018-03-13 Gilles de la Tourette Syndrome TS is a common albeit severely under diagnosed neuropsychiatric disorder that is caused by a complex genetic basis interacting with environmental factors High comorbidity rates with other neurodevelopmental disorders such as attention deficit hyperactivity disorder and obsessive compulsive disorder raise the intriguing hypothesis of a shared etiological background Abnormalities of corticostriatal thalamic cortical circuits CSTC and dysfunction of both dopamine and serotonin neurotransmitter systems are assumed to be associated with TS Recently multiple lines of evidence also point towards an important role of additional neurotransmitters such as histamine and glutamate For a very long time efforts to elucidate the etiology and pathophysiology of TS have been fragmented and hampered by low statistical power Finally after more than two decades of active research

aiming to identify the etiology and pathophysiology of TS we are on the verge of a new era promising exciting and rapid discoveries in the field Investigators from around the world representing multiple disciplines and scientific approaches are joining their efforts in large scale initiatives supported both by European Union and US National funding agencies such as the European funded EMTICS TACTICS and TSGeneSEE consortia the Marie Curie Initial Training Network TS EUROTRAIN and the European Society for the Study of TS joining forces with the NIH funded TSAICG GGRI and Tic Genetics consortia Importantly all these initiatives are supported by TS patient support and advocacy groups Multiple resources are being consolidated and coming together to serve the study of TS including large well characterized patient cohorts and specialized epidemiological databases such as the unique resource of the Netherlands Twin Register This research topic showcases current large scale collaborative efforts aiming to elucidate the genetic and neurobiological background of TS through diverse approaches from genomewide association studies aiming to identify common variants associated to the disorder to neuroimaging studies and animal models Furthermore current approaches on the clinical assessment and management of the disorder are presented Propelled by the gradual availability of large scale TS cohorts novel methodologies and importantly sheer enthusiasm by multiple researchers working together across different countries the new era of the neurobiology of TS holds the promise to identify novel targets for improved therapies

Wheat Evolution and Domestication Moshe Feldman, Avraham A. Levy, 2023-10-03 This open access book covers a century of research on wheat genetics and evolution starting with the discovery in 1918 of the accurate number of chromosomes in wheat We re evaluate classical studies that are pillars of the current knowledge considering recent genomic data in the wheat group comprising 31 species from the genera *Amblyopyrum* *Aegilops* *Triticum* and other more distant relatives For these species we describe morphology ecogeographical distribution phylogeny as well as cytogenetic and genomic features For crops we also address evolution under human selection namely pre domestication cultivation and domestication We re examine the genetic and archeological evidence of where when and how domestication occurred We discuss unique aspects of genome evolution and maintenance under polyploidization in natural and synthetic allopolyploids of the wheat group Finally we propose some thoughts on the future prospects of wheat improvement As such it can be of great interest to wheat researchers and breeders as well as to plant scientists and students interested in plant genetics evolution domestication and polyploidy

*The School Science Review*, 2002 Immunology at the feto-maternal interface Mahmood Jeddi-Tehrani, Amir-Hassan Zarnani, Maria Laura Zenclussen, Marie-Pierre Piccinni, 2025-09-19 Reproductive biology is the mother of other areas in biology as Reproduction had been the main strategy of simple and higher organisms to evolve The

utmost fitness in evolutionary tree is biological fitness in being beneficial for successful reproduction In this connection reproductive sciences have been the focus of many research programs Specifically reproductive immunology has received the attention of researchers more than ever This trend is largely due to the industrialization of societies the increase in the age of marriage and as a result the decrease in fertility rates On the other hand despite significant advances in the field of artificial reproductive technologies low success rate of embryo transfer is the main limiting factor for in vitro fertilization treatment Therefore understanding the immunological mechanisms of implantation and the adaptation of the immune cells of the pregnancy site which leads to the maternal immunological tolerance to fetal antigens is of utmost importance

Immunological alterations of the female reproductive tract commences from the first exposure to seminal plasma leading to molecular and cellular changes that increase the chance of conception and pregnancy through modulation of inflammatory responses and induction of paternal antigen specific regulatory T cells Steroid hormone directed decidualization of endometrium is the first step for embryo implantation and placental development which eventually leads to immunoregulation of the immune cells residing in the endometrium in favor of pregnancy Following placental development an extensive crosstalk begins among developing trophoblasts decidualized endometrial stromal cells and the decidual immune cells and establishes a unique triangle for induction of maternal immune tolerance All the processes of entire pregnancy are under the tight control of inflammation regulatory mechanisms While acute inflammation is a triggering mechanism of embryo implantation and parturition cell senescence associated with chronic inflammation in pregnancy related disorders such endometriosis chronic endometritis and hydrosalpinx is destructive and can lead to infertility or abortion
