Advanced Biosignal Processing Amine Nait-Ali,2009-04-21 Generally speaking Biosignals refer to signals recorded from the human body They can be either electrical e g Electrocardiogram ECG Electroencephalogram EEG Electromyogram EMG etc or non electrical e g breathing movements etc The acquisition and processing of such signals play an important role in clinical routines They are usually considered as major indicators which provide clinicians and physicians with useful information during diagnostic and monitoring processes In some applications the purpose is not necessarily medical It may also be industrial For instance a real time EEG system analysis can be used to control and analyze the vigilance of a car driver In this case the purpose of such a system basically consists of preventing crash risks Furthermore in certain other applications a set of biosignals e g ECG respiratory signal EEG etc can be used to control or analyze human emotions This is the case of the famous polygraph system also known as the lie detector the efficiency of which remains open to debate Thus when one is dealing with biosignals special attention must be given to their acquisition their analysis and their processing capabilities which constitute the final stage preceding the clinical diagnosis Naturally the diagnosis is based on the information provided by the processing system **Medical and Health Care Books and Serials in Print** ,1997

The bulk of the book lies in the third section on pediatric cardiology, which examines not only basic science, assessment, and therapies but also a wide variety of specific acquired and congenital diseases such as valvular lesions, arterial diseases, cyanotic heart diseases, cardiomyopathies, cardiac tumors, and pulmonary hypertension. This is followed by the section on adult congenital heart diseases, discussing echocardiography, electrophysiology, neurodevelopment, and a variety of unique aspects of congenital heart disease in the adult years.
