engine lubricating oils used in aero and aero derived marine and industrial applications along with standard test methods and requirements for laboratories performing them It also defines the quality control requirements to assure batch conformance and materials traceability and the procedures to manage and communicate changes in oil formulation and brand This specification invokes the Performance Review Institute PRI product qualification process Requests for submittal information may be made to the PRI at the address in Appendix C referencing this specification Products qualified to this specification are listed on a Qualified Products List QPL managed by the PRI Additional tests and evaluations may be required by individual equipment builders before an oil is approved for use in their equipment Approval and or certification for use of a specific gas turbine oil in aero and aero derived marine and industrial applications is the responsibility of the individual equipment builders and or governmental authorities and is not implied by compliance with or qualification to this specification AS5780A issued in 2005 is now due for revision The changes made to this document reflect the consensus of opinion of SAE E 34 committee and reflects the further development and understanding of test methods and data **Gas**

Turbine Engine Lubricant Specifications: Current Technical Review and Future Direction E-34 Propulsion Lubricants Committee,2014 This AIR describes the current scientific and engineering principles of gas turbine lubricant performance testing per AS5780 and identifies gaps in our understanding of the technology to help the continuous improvement of this specification Qualification of a turbine oil formulation to AS5780 is now recognized as an integral part of most aviation equipment manufacturer s oil approval processes The E 34 Committee identified the need to develop this document based on inputs questions and concerns from gas turbine lubricant customers equipment manufacturers military authorities and civil aviation authorities The intent is to provide a clear and concise reference which will help guide the direction of the committee s efforts in refining AS5780 *High Performance Solid and Liquid Lubricants* E. ,1943 **The Use of a Fire-Resistant Turbine Lubricant** WD. Phillips,2001 Turbine oil fires continue to cause concern

Although not frequent occurrences a serious fire can have an enormous financial impact To reduce the risk of hydraulic oil fires in steam turbines phosphate esters are now widely used but large volumes of inflammable mineral oil remain in the lubrication system In order to decrease the fire risk still further phosphates have also been used in both steam and gas turbines as fire resistant lubricants This paper reviews the need for these products and the experience in both trials and commercial operation It examines the reasons for their slow adoption by industry but also why current market pressures particularly in Europe are likely to accelerate their use

Lubricating Characteristics and Typical Properties of Lubricants Used in Aviation Propulsion and Drive Systems E-34 Propulsion Lubricants Committee,2011 This AIR establishes guidance for the specification of formulated lubricant properties which contribute to the lubricating function in bearings gears clutches and seals of aviation propulsion and drive systems Since the initial issuing of AIR5433 the lubricating requirements as well as the thermal and electrical properties of lubricants have received increased attention Further clarification of the test requirements and interpretation of test results have been made in this revision after extensive review in the E 34 Qualified Products Group and subcommittee E 34 E Aerospace Standards for Turbine Lubricants and E 34 C Lubricating Characteristics

Fire Resistant Fluids for the Control and Lubrication of Steam and Gas Turbines J. Hartwig,W. D. Phillips,1990 The risk of the fire in power stations arising from the ignition of mineral turbine oil is ever present despite the use of protective devices The hazard can be substantially reduced by the use of a fire resistant lubricant and the paper describes the use of a triaryl phosphate fluid to lubricate a 10 MW back pressure steam turbine and a 6 MW industrial gas turbine After about 56 000 hours total use in the two machines the fluid quality is still excellent No fluid related operational problems have been found and leaks which would have caused fires had mineral oil been used did not result in ignition of the fluid
