

## Course book answers

### Chapter 6

#### Getting started

- 1 carbohydrates and fats (and occasionally proteins)
- 2 sunlight
- 3 through photosynthesis in plants; they use energy from sunlight to make carbohydrates

#### Science in context: Using solar energy to make fuels

- 1 Ideas could include:
  - reduced combustion of fossil fuels, which release long-stored carbon into the atmosphere as carbon dioxide
  - use of carbon dioxide from the atmosphere for photosynthesis; this will be released again when the fuel is burnt, but overall what is released should match what has been used.
- 2 Accept any sensible ideas. For example, growing crops for biofuels uses large areas of land, which leads to damage to ecosystems and loss of habitats. Learners may also suggest that biofuels may need to be transported over long distances, which can be costly in terms of energy used and carbon dioxide released. They may also suggest that biofuels are not very 'energy dense'. Artificial photosynthesis could be done under controlled conditions, generating a lot of fuel in a relatively small space – this could perhaps be next to facilities that actually use the fuel (such as electricity generating stations).

#### Questions

- 1 Animals get all of their energy from organic substances, which they are not able to synthesise themselves. Plants synthesise organic substances from inorganic ones, using sunlight as an energy source.
- 2 Chlorophyll absorbs energy from sunlight. (*Do not accept 'attracts sunlight'.*) The energy enables carbon dioxide and water to react to produce carbohydrates.
- 3 two

#### Activity 6.1

- 1 The model shows that six molecules of carbon dioxide and six molecules of water produce one molecule of glucose and six molecules of oxygen.
- 2 Accept any sensible suggestions. For example, some pieces of orange card could be used to represent energy in sunlight, and a learner could hand some to the learners who are building the glucose molecule. The cards can be placed in the carton with the glucose molecule, showing that the energy is incorporated into it.
- 3 The oxygen that is released in photosynthesis comes from water molecules, not carbon dioxide. All the carbon and oxygen in the carbon dioxide becomes part of the glucose molecule.

#### Questions

- 4 Starch is a storage material, and if you are storing something you need to be able to get it back again when required. Plants need to be able to break down starch to glucose, so that they can use it in respiration to provide energy. Cellulose, however, is a structural material, used to make cell walls. It needs to stay there, not be broken down, or the cell walls would easily break apart.
- 5 glycogen
- 6 Not all parts are exposed to light (e.g. roots) and not all parts have chloroplasts (e.g. flowers) so they cannot photosynthesise and make their own carbohydrates.

7

Element	nitrogen	magnesium
Mineral salt	nitrate ions	magnesium ions
Why needed	to make amino acids, and then proteins	to make chlorophyll
Deficiency	weak growth, yellow leaves	yellowing of leaves, often especially between the veins
