Handbook of Health and Migration in Latin America and the Caribbean Alfonso Urzúa, Baltica Cabieses, 2025-04-30 This handbook presents a comprehensive overview of theories and scientific evidence related to the complex and dynamic relationship between migration and population health in Latin America and the Caribbean According to the International Organization for Migration IOM it is estimated that as of 2020 there were more than 281 million international migrants around the world From that total 43 million are in Central and South America and the Caribbean But despite the relevance of migratory movements in these regions most of the scientific knowledge about health and migration is produced by researchers from the Global North which has produced a significant North South divide that profoundly affects how knowledge is theorized researched and transferred into practice globally This volume aims to contribute to

reducing this gap by bringing together chapters that discuss health and migration in Latin America and the Caribbean based mainly on publications and scientific reports produced in the region and written by local experts coming from both the health and social sciences For too long research and policy in global health have been predominantly influenced by North American and European institutions perspectives and priorities In contrast Latin America brings forward a distinctive and rich research tradition in the health sciences with a vibrant research community dedicated to social medicine and critical approaches in social epidemiology These perspectives are particularly well suited for analyzing the social structural and political determination of health inequities including those related to migration This handbook therefore is not only an academic contribution but a vital call for regionally grounded research innovative theoretical approaches and a much needed rebalancing of the global discourse on migration and health Michael Knipper Lancet Migration Regional Focal Point for Latin America Some chapters of this handbook were originally written in Spanish and translated into English with the help of artificial intelligence A subsequent human revision was done primarily in terms of content

The Evolutionary Mechanism of Human Dysfunctional Behavior

Ivan Fuchs,2019-04-18 Why is humanity by far the most successful animal in the animal kingdom but when it comes to survival of the fittest we pull against the impulse toward natural selection Unique among vertebrates humans develop and practice varied forms of dysfunctional or maladaptive behavior the graver of which are categorized as mental disorders which doesn t sustain our species Dr Ivan Fuchs explains why this is the case setting his discussion within the fields of psychiatry evolutionary biology and genetics marshalling a wide range research to make a compelling case In this work Dr Ivan Fuchs provides his theory on human dysfunctional behavior rooted in Darwinian evolutionary thinking His theory includes 1 An attempt to identify the basic evolutionary mechanism that leads to dysfunctional or maladaptive behavior that is increasing in human populations He proposes that this mechanism consists of progressive relaxation of selection pressures originating in the natural environment

as a result of the technological and cultural development in human civilization These developments protect against many natural inconveniences and dangers such as harmful weather conditions scarce or unreliable food supplies cruel even deadly competition for life sustaining or reproductive resources danger of predation and so on The relaxation of natural selection pressures leads to excessive diversification of innate predispositions that due to the complexities of social coexistence has both far reaching beneficial as well as harmful consequences 2 Dr Fuchs deals primarily with severe forms of dysfunctional behavior categorized as mental disorders pinpointing those genetically based behavioral complexes which predispose humans to anxiety affective and personality disorders paranoia and schizophrenia 3 Dr Fuchs also makes clear that the above innate predispositions cannot lead by themselves to the whole clinical picture of diagnosable mental disorder categories In order for full blown clinical symptomatology to develop the innate predisposition has to interact with influences after childbirth first of all learning Consequently psychiatric understanding and research has to distinguish sharply between those mental brain structures and functions which constitute the innate predisposition to a certain mental disorder versus those ones involved secondarily during the lifespan This consideration is detailed in the case of schizophrenia spectrum of disorders The above theoretical considerations have important therapeutic preventive and research implications The Missing Gene Jay Joseph, 2006 What causes psychiatric disorders to appear Are they primarily the result of people's environments or of their genes Increasingly we are told that research has confirmed the importance of genetic influences on schizophrenia depression bipolar disorder
