A Coastal Marine Ecosystem J. N. Kremer, S. W. Nixon, 2012-12-06 One aim of the physical sciences has been to give an exact picture of the material world One achievement of physics in the twentieth century has been to prove that that aim is unattainable There is no absolute knowledge And those who claim it whether they are scientists or dogmatists open the door to tragedy All information is imperfect We have to treat it with humility Bronowski 1973 *The Ascent of Man* It seems particularly appropriate to us to begin this book with Jacob Bronowski's passionate message firmly in mind Those who set out to construct numerical models especially ones that are mechanistic and essentially deterministic must work always with this awareness as a backdrop for their efforts But this is also true for the most meticulous physiologist or observant naturalist We are all dealing with simplifications and abstractions all trying to figure out how nature works Unfortunately this common pursuit does not always lead to mutual understanding and we have become increasingly aware over the past six years that many ecologists feel a certain hostility or at least distrust toward numerical modeling In a number of cases the reasons for such feelings are personal and very understandable hard gotten data skimmed off by someone with little appreciation for the difficulties involved in obtaining reliable measurements grandiose claims of predictability the tendency for some model builders to treat other scientists as number getters whose research can be directed in response to the needs of the model etc

Guderian, 2012-12-06 Emissions of gaseous air pollutants have increased in the last years in spite of increased controls and concern for air quality Predictions of future development also indicate that a further increase in emissions must be expected From an extensive analysis of fuel use in conventional power plants in industry and for domestic heating Brocke

and Schade 1971 and Schade 1975 predict that sulfur dioxide SO<sub>2</sub> emissions in the Federal Republic of Germany will increase from 3.5 million t in 1969 over 4.2 million t in 1973 to 4.6 million t in 1980 Rasch 1971 predicts that emission of hydrogen chloride HCl from burning of wastes will increase from a present 8000 t year to about 100000 t in 1980 Emission of gaseous fluoride compounds in North Rhine Westphalia alone are expected to increase from 7500 t in 1969 to 8800 t in 1985 MAGS 1972 Similar predictions have also been made in the USA Heggestadt and Heck 1971 A doubling of SO<sub>2</sub> emissions from oil and particularly coal fired power plants is expected between 1960 and 1980 Wood 1968 Lewis et al 1974 When it is considered that total control of air pollutants is technically and especially economically impossible it is important that in the future emissions are controlled within a technical and economic framework to such an extent that ambient pollutant concentrations near the ground present no hazard to man or his environment BImSchG 1974

Microbial Ecology of a Brackish Water Environment G. Rheinheimer, 2012-12-06 A knowledge which is as accurate as possible of microbial ecology is indispensable for ecosystem research and environmental protection This is particularly true for coastal waters whereby brackish water areas occupy a special position After several years of preliminary studies on the composition and distribution of the micro flora algae fungi and bacteria a comprehensive investigation on the primary production bacterial development and microbial uptake and decomposition of substances in the Kiel Bight was carried out during which ten scientists from the Institut für Meereskunde of Kiel University participated Here for the first time numerous hydrographical chemical and microbiological parameters could be measured on the same water samples The aim of this joint project was to gain an insight into the manifold functions of the microorganisms in the uptake and degradation of organic substances and in the connections between pollution production and remineralization The results of the investigations led not only to new knowledge of the role of the microorganisms in the brackish water ecosystem but also to a revision of earlier conceptions especially on the influence of wastes on the micro flora and its role in the self purification of coastal waters Such a time limited investigation however cannot clarify all the questions on the complex relationships between the microorganisms and their biotope Therefore the present volume should also be understood as a stimulus for new and further reaching research on the microbial ecology of coastal waters Thereby the most important methods are described as well as the practical experience obtained
