- Abstract: The purpose of this study was to determine the effect of a 12-week, low-intensity, low-impact, and low-impact aerobics program on the physical fitness of sedentary, middle-aged women. The study was conducted in a community-based setting. The participants were 12 women, aged 40-50, who were sedentary and had no history of cardiovascular disease. The program consisted of three sessions per week, each lasting 30 minutes. The first session was a low-intensity aerobics program, the second session was a low-impact aerobics program, and the third session was a low-impact aerobics program. The results of the study showed that the participants had a significant improvement in their physical fitness, including a decrease in body mass index (BMI), an increase in heart rate, and an increase in the number of steps taken per day. The study suggests that a 12-week, low-intensity, low-impact, and low-impact aerobics program can be an effective way to improve the physical fitness of sedentary, middle-aged women.
