Fundamental Papers in Wavelet Theory Christopher Heil, David F. Walnut, 2009-01-10 This book traces the prehistory and initial development of wavelet theory a discipline that has had a profound impact on mathematics physics and engineering Interchanges between these fields during the last fifteen years have led to a number of advances in applications such as image compression turbulence machine vision radar and earthquake prediction This book contains the seminal papers that presented the ideas from which wavelet theory evolved as well as those major papers that developed the theory into its current form These papers originated in a variety of journals from different disciplines making it difficult for the researcher to obtain a complete view of wavelet theory and its origins Additionally some of the most significant papers have heretofore been available only in French or German Heil and Walnut bring together these documents in a book that allows researchers a complete view of wavelet theory s origins and development

Collected Works (volume 1): Published Papers Stephen Luttrell, 2023-10-24 The motivation for the research that is described in these volumes is the wish to explain things in terms of their underlying causes rather than merely being satisfied with phenomenological descriptions When this reductionist approach is applied to information processing it allows the internal structure of information to be analysed so information processing algorithms can then be derived from first principles One of the simplest examples of this approach is the diagonalisation of a data covariance matrix there are many variants of this basic approach such as singular value decomposition in which the assumed independent components of high dimensional data are identified and extracted The main limitation of this type of information analysis approach is that it is based on linear algebra applied globally to the data space so it is unable to preserve information about any local data structure in the data space For instance if the data lives on a low dimensional curved manifold embedded in the data space then only the global properties of this manifold would be preserved by global linear algebra methods In practice data whose high dimensional structure is non trivial typically lives on a noisy version of a curved manifold so techniques for analysing such data must automatically handle this type of structure For instance a blurred image of a point source is described by its underlying degrees of freedom i.e. the position of the source and as the source moves about it generates a curved manifold that lives in the high dimensional space of pixel values of the sampled image The basic problem is then to deduce the internal properties of this manifold by analysing examples of such images A more challenging problem would be to extend this analysis to images that contain several overlapping blurred images of point sources and so on There is no limit to the complexity of the types of high dimensional data that one might want to analyse These methods then need to be automated so that they do not rely on human intervention which would then allow them to be inserted as components into

information processing networks The purpose of the research that is described in these volumes is to develop principled information processing methods that can be used for such analysis Self organising information processing networks arise naturally in this context in which ways of cutting up the original manifold into simpler pieces emerge automatically

this research has been driven by the growing availability of spatially explicit social science data and the development of tools and methodological advances to use these data. Collected in this volume are 24 key articles considering the reasons for spatial variation in policies due to either efficiency or equity considerations and the consequences of that spatial variation for both environmental and economic outcomes. These articles demonstrate that the failure to address spatial issues in the analysis can create two problems: 1 the analysis provides a poor basis for predicting actual behaviour that is specifically based upon spatial considerations and 2 the analysis fails to provide a basis for designing spatially targeted policies that could lead to more efficient outcomes.

Readings in Computer Vision Martin A. Fischler, Oscar Firschein, 1987-06. The field of computer vision combines techniques from physics, mathematics, psychology, artificial intelligence and computer science to examine how machines might construct meaningful descriptions of their surrounding environment. The editors of this volume, prominent researchers and leaders of the SRI International AI Center Perception Group, have selected sixty papers most published since 1980 with the viewpoint that computer vision is concerned with solving seven basic problems: Reconstructing 3D scenes from 2D images; Decomposing images into their component parts; Recognizing and assigning labels to scene objects; Deducing and describing relations among scene objects; Determining the nature of computer architectures that can support the visual function; Representing abstractions in the world of computer memory; Matching stored descriptions to image representation. Each chapter of this volume addresses one of these problems through an introductory discussion which identifies major ideas and summarizes approaches and through reprints of key research papers. Two appendices on crucial assumptions in image interpretation and on parallel architectures for vision applications, a glossary of technical terms and a comprehensive bibliography and index complete the volume.
