The Parts of the Respiratory System

- Nose
- Pharynx (throat)
- Larynx (voice box)
- Trachea (windpipe)
- Bronchi (primary branching from trachea to smaller bronchioles)
- Alveoli

Right and Left Lungs

The Mechanisms of Respiration

Inhalation and exhalation of the lungs involves the contraction and relaxation of the diaphragm and the external intercostal muscles.

Mechanisms of Respiration

During normal quiet breathing, the diaphragm contracts and flattens, increasing the volume of the thoracic cavity.

As the volume increases, the pressure inside decreases, creating a negative pressure, and the negative pressure is below atmospheric pressure, air is drawn in.

Exhalation is a passive process. The diaphragm relaxes and returns to its original shape, decreasing the volume of the thoracic cavity.

As the volume decreases, the pressure inside increases, creating a positive pressure, and the positive pressure is above atmospheric pressure, air is forced out.

The Mechanisms of Respiration

Inhalation and exhalation of the lungs involves the contraction and relaxation of the diaphragm and the external intercostal muscles.

Muscles of Respiration

- External intercostal muscles (on sides)
- Internal intercostal muscles (on sides)
- Diaphragm
- Abdominal muscles (on sides)
- Rectus abdominus (on sides)

Diaphragm

- Diaphragm: a large muscle that separates the chest from the abdomen.
- It contracts and relaxes to change the volume of the thoracic cavity.
- It is innervated by the phrenic nerve.

Factors Affecting Respiration

- Compliance:** Ease of stretching of the connective tissues in the lungs with increased breathing effort.
- Surfactant:** Substance that reduces surface tension, preventing alveoli from collapsing. Low compliance, lung cells are resistant to expansion.
- Alveolar surface area:** The total area of the alveoli.
- Capillary blood flow:** The rate at which blood flows through the capillaries.
- Partial pressure of oxygen in alveoli:** The pressure of oxygen in the alveoli.

Lung Volumes

- Residual Volume:** The volume of air that remains in the lungs after a maximal expiration.
- Tidal Volume:** The volume of air that enters or leaves the lungs during a normal breath.
- Inspiratory Reserve Volume:** The volume of air that can be inhaled after a normal inspiration.
- Expiratory Reserve Volume:** The volume of air that can be exhaled after a normal expiration.
- Vital Capacity:** The maximum volume of air that can be exhaled after a maximal inspiration.
- Functional Residual Volume:** The volume of air that remains in the lungs after a normal expiration.
- Total Lung Capacity:** The maximum volume of air that the lungs can hold.

Composition of Inspired and Expired Air

	Inspired Air	Expired Air
Oxygen	21%	16%
Carbon Dioxide	0.04%	4%
