Abstract

In this paper, we study the solution of certain optimal control problems by the use of an off-line Riccati Partial Differential Equation which is shown to be equivalent to the Hamilton-Jacobi-Bellman (HJB) equation, when the value function is sufficiently smooth. We develop a geometric existence theory for classical, weak and generalized solutions of the Riccati Partial Differential Equation. For finite and infinite time horizon problems, we also investigate the relationship of such solutions to optimal control laws. Indeed, as corollaries of certain of our existence results, we obtain smoothness results for the value function of the corresponding optimal control problem.

1 Introduction

Consider a control system having the form

$$\dot{x} = f(x) + g(x)u(t) \quad (1.1)$$

where $x \in \mathbb{R}^n$, and where for each t , $u(t) \in \mathbb{R}^m$. We assume that the vector fields f , g_i are C^r in x , $r \geq 1$ and that the $u_i(t)$ are piecewise continuous functions. In particular, for each pair $(x(0), u(t))$, the system (1.1) has a unique solution for $t < \infty$. Furthermore, we assume that $f(0) = 0$. For the system (1.1) we shall consider the problem of minimizing the cost functional

$$J^T(x(0), u) = \int_0^T L(x, u) dt + Q(x(T)) \quad (1.2)$$

for both the cases $T < \infty$, and for $T = \infty$ and $Q(x) \equiv 0$.

Our initial assumptions concerning (1.2) are that $Q(x)$ is C^{q+1} , $q \geq 1$ and that $L(x, u)$ is C^{s+1} , $s \geq 1$, and satisfies:

H1: for each fixed x , $\frac{\partial L}{\partial u}(x, \cdot)$ is a diffeomorphism;

H2: for each fixed x , $L(x, u)$ has a minimum at $u = 0$, and $L(0, 0) = 0$.

Polymer Microscopy Linda C. Sawyer, 2012-12-06 Modern materials include a vast array of polymers and plastics which are found in applications such as housing appliances clothing and household textiles and automotive and aerospace industries Thus research scientists engineers and materials science graduate students need to be aware of the methods and techniques required to understand the structure property relations of polymer materials This book will review the field of the microscopy of polymers There is a vast literature which describes the research results obtained by study of polymer materials using microscopy and other complementary analytical techniques and such studies are best left to journals on specific topics The major objective of this text is to provide the basic microscopy techniques and specimen preparation methods applicable to polymers The book will attempt to provide enough detail so that the methods described can be applied and also to reference appropriate publications for the investigator interested in more detail The selection of two authors for this text came from the desire for a comprehensive review of polymer microscopy with emphasis on methods and techniques rather than on research results The synergism provided by two authors with widely varied backgrounds was thought to be important one author LCS has an industrial focus and a background in chemistry whilst the other DTG has an academic environment and offers a background in polymer physics
