The denominator cannot be 0, but the numerator can be. Example: The number 6 is a rational number because it can be written as the fraction $\frac{6}{1}$. All integers are rational numbers.

Irrational Number ... a number that cannot be expressed as a ratio between two integers. It neither is decimal notation, an irrational number would have an infinite number of digits to the right of the decimal point, without repeating. The value of π (3.14159...) and the square root of 2 ($\sqrt{2}$) are examples of irrational numbers.

Real Number ... (also called measuring numbers); any rational or irrational number; each of the infinite number of points on the real number line represents a real number. This includes all numbers that can be written as a decimal and fractions is also in decimal form.

Place Value ... in a whole number, it's the position a certain digit occupies. In the GED® Math test ask you, "what is the place value of the 5 in this number 5,500?" the 5 occupies the hundred place, so that's its place value.

Value of a digit ... defined from place value, the position of a digit in a number determines its value; for example, in the number 7,500 the value of 7 is 7 times its place value, or $7 \times 1,000 = 7,000$.
