

The figure below shows the three types of survivorship curves.

Label	Type I, II, or III?	Description of strategy	Example organisms that use this strategy
A	Type I	Organisms have very low offspring and take very good care of them to ensure their survival. High survival at young, because it's really easy to take care of as they age.	Large mammals (ex. humans, elephants, horses, whales, whales)
B	Type II	Organisms equally likely to die at any point throughout their life.	Small animals (ex. Robins!) Predating birds (larks)
C	Type III	Organisms have many offspring and do not take much care to ensure they survive.	Fish Small insects Small plants

What is meant by **population distribution**?

To summarize, the three main population distribution patterns could be shown in the table below:

Type of distribution	Picture of distribution	Why use this pattern?
Clumped	 	VERY COMMON Safety in numbers, social interactions, mating and caring for young, resources are shared.
Dispersed	 	Spatial avoidance, territoriality
Random	 	VERY COMMON It's random (ex. seeds blown by wind, small seed germination, no resource location).

Fruit Sampling Guidelines for Area-Wide Fruit Fly Programmes
Food and Agriculture Organization of the United Nations, 2019-08-29 Population survey is a basic component of any area wide integrated pest management programme Pest surveillance measures have to be practical cost effective and provide reliable information to action programme managers Fruit fly trapping provides useful information on the presence or absence of the pest and on its relative spatial distribution and abundance However performance and thus effectiveness of trapping systems can be affected by extrinsic factors including changing environmental and ecological conditions Under certain conditions fruit sampling becomes a suitable tool for population sampling For example at the beginning or end of the fruiting

season when fewer mature fruits are still available on the trees larvae could be more easily detected Fruit sampling also becomes an important pest detection tool in areas where sterile flies are being continuously released and where low density trapping is kept to avoid high sterile fly recapture rate and where traps are aimed basically at monitoring the released sterile flies
