Giles,J.S. Griffiths,2020-06-09 The UK is perhaps unique globally in that it presents the full spectrum of geological time stratigraphy and associated lithologies within its boundaries With this wide range of geological assemblages comes a wide range of geological hazards whether they be geophysical earthquakes effects of volcanic eruptions tsunami landslides geotechnical collapsible compressible liquefiable shearing swelling and shrinking soils geochemical dissolution radon and methane gas hazards or georesource related coal chalk and other mineral extraction An awareness of these hazards and the risks that they pose is a key requirement of the engineering geologist The Geological Society considered that a Working Party Report would help to put the study and assessment of geohazards into the wider social context helping the engineering geologist to better communicate the issues concerning geohazards in the UK to the client and the public This volume sets out to define and explain these geohazards to detail their detection monitoring and management and to provide a basis for further research and understanding **Chemistry of the Lower Atmosphere** S. Rasool,2012-12-06 About three years ago Catherine de Berg and I published a short article in Nature in which we attempted to explain why the chemistry of the atmosphere of the Earth is today so completely different from that of our two neighbor ing planets Mars and Venus Our atmosphere is composed mainly of N₂ and O₂ with traces of A H₂ CO₂ etc while the atmospheres of both 2 2 2 3 Mars and Venus are almost entirely made up of CO₂ Also the Earth appears 2 to be the only one ofthe three planets which has oceans ofliquid water on the surface Since the presence of liquid water on Earth is probably an essential requirement for life to have originated and evolved to its present state the question of the apparent absence ofliquid water on Mars and Venus suddenly acquires significant proportions In our paper in Nature and later in a more detailed discussion of the subject Planetary Atmospheres in Exobiology edited by C Ponnampertuma North Holland Publishing Co we tried to describe why we believe that in the early history of the solar system all the terrestrial planets lost the atmospheres of H₂ and He which they had acquired from the solar nebula at the time of their formation These planets completely devoid of atmos pheres like the Moon today started accumulating new gases which were exhumed from the interior by the commencement of volcanic activity *Earth Science in the Urban Ocean* Homa J. Lee,William R. Normark,2009 Section 1 deals with surficial seafloor mapping and characterization Sections 2 and 3 deal with fundamental geologic and oceanographic processes that introduce transport and deposit sediment particles and contaminants in the Southern California Bight T **Part 3.
