

1. Complete these definitions or ideas that are central to understanding the Hardy-Weinberg theorem.
 - a. Population: A group of individuals of the same species that live in the same area and interbreed to produce fertile offspring
 - b. Gene pool: The total aggregate of all the alleles for all of the loci for all of the individuals in a population
 - c. Genetic drift:
 - d. Allele frequency:
 - e. Genotype:
 - f. Phenotype:
2. Suppose that there is a population of plants that have flower color that is controlled by one gene. Where R is completely dominant and codes for a red flower over r is recessive and encodes a white flower.

A flower that is heterozygous will have a genotype of Rr and a phenotype of RED
3. Consider the example of the medium ground finch (*Geospiza fortis*), a seed-eating bird that lives on the Galápagos Islands. In 1977, the *G. spiza* population endured a long period of drought. Of 1200 birds, only 180 survived. The surviving finches had larger, deeper beaks than the finches that died. Soft, small seeds were in short supply during the drought. Large, hard seeds were more abundant. Finches with large, deep beaks could crack the large seeds and thus were able to survive the food shortage during the drought.

A common misconception is that individual organisms evolve over their lifetimes. However, evolution is the changes in the population overtime.

 - a. Natural selection does act on individuals. Explain how individuals did not evolve and natural selection acted on the individual finches in the example above.

Individual finches did not evolve. Each bird had a beak of a particular size, which did not grow larger during the drought.
 - b. Explain how the finch population evolved from one generation to the next in the example above.

The proportion of birds with large beaks in the population increased from generation to generation because birds with large beaks were better able to survive the drought and reproduce successfully
4. In this chapter we discuss changes in allele frequencies in a population from one generation to the next. This type of evolution is called MICRO EVOLUTION
5. There are three (3) mechanisms that can change allele frequencies in a population. State them below.
 - a. Natural Selection
 - b. Genetic Drift
 - c. Gene flow
