Intelligent Systems: From Theory to Practice Vassil Sgurev,Mincho Hadjiski,2010-09-23 In the modern science and technology there are some research directions and challenges which are at the forefront of world wide research activities because of their relevance This relevance may be related to different aspects First from a point of view of researchers it can be implied by just an analytic or algorithmic difficulty in the solution of problems within an area From a broader perspective this relevance can be related to how important problems and challenges in a particular area are to society corporate or national competitiveness etc Needless to say that the latter more global challenges are probably more decisive a driving force for science seen from a global perspective One of such meta challenges in the present world is that of intelligent systems For a long time it has been obvious that the complexity of our world and the speed of changes we face in virtually all processes that have impact on our life imply a need to automate many tasks and processes that have been so far limited to human beings because they require some sort of intelligence

Pure and Applied Science Books, 1876-1982 ,1982 Over 220 000 entries representing some 56 000 Library of Congress subject headings Covers all disciplines of science and technology

e.g. engineering, agriculture and domestic arts. Also contains at least 5000 titles published before 1876. Has many applications in libraries, information centers and other organizations concerned with scientific and technological literature. Subject index contains main listing of entries. Each entry gives cataloging as prepared by the Library of Congress. Author title indexes.

Solving Polynomial Equations Alicia Dickenstein, 2005-04-27. This book provides a general introduction to modern mathematical aspects in computing with multivariate polynomials and in solving algebraic systems. It presents the state of the art in several symbolic numeric and symbolic numeric techniques including effective and algorithmic methods in algebraic geometry and computational algebra, complexity issues and applications ranging from statistics and geometric modelling to robotics and vision. Graduate students as well as researchers in related areas will find an excellent introduction to currently interesting topics. These cover Groebner and border bases, multivariate resultants, residues, primary decomposition.

Multivariate polynomial factorization, homotopy continuation, complexity issues and their applications. **Tensor Calculus and Differential Geometry for Engineers** Shahab Sahraee, Peter Wriggers, 2023-11-10. The book contains the basics of tensor algebra as well as a comprehensive description of tensor calculus both in Cartesian and curvilinear coordinates. Some recent developments in representation theorems and differential forms are included. The last part of the book presents a detailed introduction to differential geometry of surfaces and curves which is based on tensor calculus. By solving numerous exercises the reader is equipped to properly understand the theoretical background and derivations. Many solved problems are provided at the end of each chapter for in-depth learning. All derivations in this text are carried out line by line which will help the reader to understand the basic ideas. Each figure in the book includes descriptive text that corresponds with the theoretical derivations to facilitate rapid learning. **Spectral Approximation of Linear Operators** Francoise

Engineering Applications of Noncommutative Harmonic Analysis Gregory S. Chirikjian, Alexander B. Kyatkin, 2021-02-25. First published in 2001. The classical Fourier transform is one of the most widely used mathematical tools in engineering. However, few engineers know that extensions of harmonic analysis to functions on groups hold great potential for solving problems in robotics, image analysis, mechanics and other areas. For those that may be aware of its potential value, there is still no place they can turn to for a clear presentation of the background they need to apply the concept to engineering problems. *Engineering Applications of Noncommutative Harmonic Analysis* brings this powerful tool to the engineering world. Written specifically for engineers and computer scientists, it offers a practical treatment of harmonic analysis in the context of particular Lie groups, rotation and Euclidean motion. It presents only a limited number of proofs, focusing instead on providing a review of the fundamental mathematical results unknown to most engineers and detailed discussions of specific applications. Advances in pure mathematics can lead to very tangible advances in engineering, but only if they are available and accessible to engineers. *Engineering Applications of Noncommutative Harmonic Analysis* provides

the means for adding this valuable and effective technique to the engineer's toolbox

Intelligent Systems Vassil Sgurev, Ronald R. Yager, Janusz Kacprzyk, Krassimir T. Atanassov, 2016-10-27 This volume is a brief yet comprehensive account of new development tools techniques and solutions in the broadly perceived intelligent systems New concepts and ideas concern the development of effective and efficient models which would make it possible to effectively and efficiently describe and solve processes in various areas of science and technology Special emphasis is on the dealing with uncertainty and imprecision that permeates virtually all real world processes and phenomena and has to properly be modeled by formal and algorithmic tools and techniques so that they be adequate and useful The papers in this volume concern a wide array of possible techniques exemplified by on the one hand logic probabilistic fuzzy intuitionistic fuzzy neuro fuzzy etc approaches On the other hand they represent the use of such systems modeling tools as generalized nets optimization and control models systems analytic models etc They concerns a variety of approaches from pattern recognition image analysis education system modeling biological and medical systems modeling etc

Fuzzy Partial Differential Equations and Relational Equations Masoud Nikravesh, Lofti A. Zadeh, Victor Korotkikh, 2013-04-17 During last decade significant progress has been made in the oil industry by using soft computing technology Underlying this evolving technology there have been ideas transforming the very language we use to describe problems with imprecision uncertainty and partial truth These developments offer exciting opportunities but at the same time it is becoming clearer that further advancements are confronted by fundamental problems The whole idea of how human process information lies at the core of the challenge There are already new ways of thinking about the problems within theory of perception based information This theory aims to understand and harness the laws of human perceptions to dramatically improve the processing of information A matured theory of perception based information is likely to be properly positioned to contribute to the solution of the problems and provide all the ingredients for a revolution in science technology and business In this context Berkeley Initiative in Soft Computing BISC University of California Berkeley from one side and Chevron Texaco from another formed a Technical Committee to organize a Meeting entitled State of the Art Assessment and New Directions for Research to understand the significance of the fields accomplishments new developments and future directions The Technical Committee selected and invited 15 scientists and oil industry experts as technical committee members from the related disciplines to participate in the Meeting which took place at the University of California Berkeley and March 15 17 2002

Flexible Robot Dynamics and Controls Rush D. Robinett III, John Feddema, G. Richard Eisler, Clark Dohrmann, Gordon G. Parker, David G. Wilson, Dennis Stokes, 2012-12-06 This book is the result of over ten 10 years of research and development in flexible robots and structures at Sandia National Laboratories The authors decided to collect this wealth of knowledge into a set of viewgraphs in order to teach a graduate class in Flexible Robot Dynamics and Controls within the Mechanical Engineering Department at the University of New Mexico UNM These viewgraphs encouragement

from several students and many late nights have produced a book that should provide an upper level undergraduate and graduate textbook and a reference for experienced professionals. The content of this book spans several disciplines including structural dynamics, system identification, optimization, and linear, digital, and nonlinear control theory, which are developed from several points of view including electrical, mechanical, and aerospace engineering as well as engineering mechanics. As a result, the authors believe that this book demonstrates the value of solid applied theory when developing hardware solutions to real world problems. The reader will find many real world applications in this book and will be shown the applicability of these techniques beyond flexible structures, which in turn shows the value of multidisciplinary education and teaming.
