

### Chassis Roll with Equal Length, Parallel Links

As the chassis rolls, the camber angles change by the same amount. The positive camber change on the outside wheel is a major cause of concern here, as the outside tire will then do a poor job of maintaining traction around a corner.

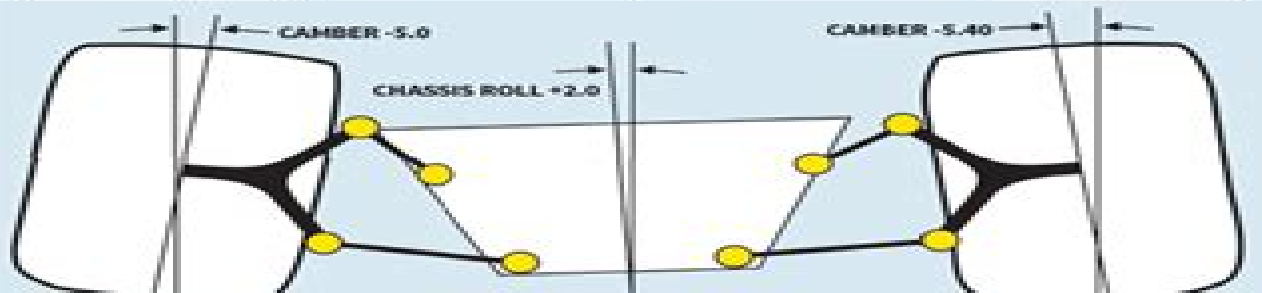

### Chassis Roll with Unequal Length, Parallel Links

The different upper and lower link lengths change the camber radius. The shorter the upper link, the sharper the camber radius. This configuration of unequal length links reduces the amount of camber change on the outside wheel as the chassis rolls in a corner, but in turn causes excessive negative camber on the inside wheel.

### Chassis Roll with Unequal Length, Non-Parallel Links

When the links are both unequal length and not parallel to each other, the camber radius on both sides become even more favorable. Although this configuration shows improvement, the tires still see more camber change than what they want for maximum grip.

### Chassis Roll and Bump with Unequal Length, Non-Parallel Links

Despite this configuration's benefits of reduced camber change as shown above, problems can occur when additional bump is introduced during body roll in a corner. The angle of the upper link becomes drastically sharper as it pulls the knuckle inward. The wheel then tilts into extremely excessive camber angles.
