## CHAPTER 13 DNA Fingerprinting

**“Genetic Prints Help Solve Mystery of Girls Switched at Birth.” “Murder Conviction Overturned by DNA Testing: Prisoner Released.”** Headlines such as these have become commonplace in recent years due to the forensic method of DNA fingerprinting, originally developed in Britain in the early 1980s. DNA fingerprinting is a method for visualizing sequences of DNA. Every person (except identical twins) has a unique sequence of base pairs. In DNA fingerprinting, scientists analyze a small number of DNA sequences that are known to vary a great deal among individuals. DNA fingerprinting has become an important tool in investigating criminal cases, identifying bodily remains, tracing heritage, and studying genetic disorders. In this activity, you will investigate the technique of DNA fingerprinting and learn how this science of identity is used to solve problems of family heritage and criminal justice.

### Part A: How to Make a DNA Fingerprint

**Step 1:** DNA is extracted from cells and cut into fragments by restriction enzymes.

**Step 2:** The DNA fragments are placed on an electrophoresis gel, and electric current is applied. DNA, being negatively charged, moves through the gel to the positively charged electrode. The fragments spread out according to size.

**Step 3:** DNA fragments are separated by chemicals into single strands. Because the strands will disintegrate after a day or two, they are transferred from the gel onto a sheet of nylon. DNA probes, which are synthetic DNA segments with known sequences, are labeled with radioactive compounds. The probes are then applied to the nylon, and complementary sequences on the DNA fragments being tested attach to the probes by base pairing.

**Step 4:** The nylon sheet is exposed to X-ray film, and dark bands appear wherever the fragment DNA (from the sample) has attached to the probe.

### Analyze and Conclude

*Respond to each question.*

- 1. Identify** In Set 2 of the DNA fingerprints, do any of the bands in the alleged father's DNA fingerprint match a band in the child's DNA fingerprint?
- 2. Theorize** What does this result indicate?

Set 1: Paternity Exclusion

Set 2: Paternity Inclusion

Figure 1

The DNA fingerprints in Figure 1 can be used to determine the paternity of a child. In Set 1 of the DNA fingerprints, one of the bands in the child's DNA fingerprint is also present in the mother's DNA fingerprint. Because none of the bands in the alleged father's DNA fingerprint matches the child's bands, he cannot be the father.
