Embedded System Development Process Roger Hu,2020-02-13 It is the megatrend in today s digital connected world each and every personal gadget from palmtop smart cellular game set top box

to wearable devices is getting thinner lighter shorter smaller and of course low power The global competition and shorter product life cycle post a major challenge to the product development It is getting harder to meet customer s demands on time because customers want the products to be done as early as possible The reason is simple competitions are so high and the technology advances are so fast Because the time to market is very short for a new product introduction the development of a new product is often started too hastily no development plan do not follow the golden process flow no thorough reviews incomplete test cases waive bugs etc so engineers and developers have to repeat what they have done to fix things in the end everything takes much longer than it should be A good design flow can reduce time to market meanwhile improve product s quality Software development is usually questionable for its poor quality and unreliability Buggy code improper interfaces and missing features are almost encountered by the users of most embedded system The embedded system developers are filled with consequence of missed deadlines and huge cost overruns Embedded system developers can benefit from high quality design flow by identifying optimal product architecture and executing a high quality design process Embedded software development tools are also vitally important for productive development and keeping development in control The purpose of writing this software design process flow is to ensure that by following a high quality process and right set of development tools the developers shall possess the highest quality of products while maintaining a competitive schedule and a lower cost structure
