Clocking the Mind Arthur R. Jensen,2006-07-10 Mental Chronometry MC comprises a variety of techniques for measuring the speed with which the brain processes information First developed in mid 1800 MC was subsequently eclipsed by more complex and practically useful types of psychometric tests stemming from Alfred Binet This class of mental tests however has no true

metric relating the test scores to any specific properties of the brain per se The scores merely represent an ordinal scale only ranking individuals according to their overall performance on a variety of complex mental tasks The resulting scores represent no more than ranks rather than being a true metrical scale of any specific dimension of brain function Such an ordinal scale which merely ranks individuals in some defined population possesses no true scale properties possessing neither a true zero or equal intervals throughout the scale This deficiency obstructs the development of a true natural science of mental ability The present burgeoning interest in understanding individual differences in mental abilities in terms of the natural sciences biology and the brain sciences in particular demands direct measures that functionally link brain and behavior One such natural ratio scale is time itself the time it takes the brain to perform some elementary cognitive task measured in milliseconds After more than 25 years researching MC Jensen here presents results on an absolute scale showing times for intake of visual and auditory information for accessing short term and long term memory and other cognitive skills as a function of age at yearly intervals from 3 to 80 years The possible uses of MC in neurological diagnosis and the monitoring of drug effects on cognition the chronometric study of special time sensitive talents such as musical performance and presents a theory of general intelligence or g as a function of the rate of oscillation of neural action potentials as measured by chronometric methods Finally Jensen urges the world wide standardization of chronometric methods as necessary for advancing MC as a crucial branch of biopsychological science Provides a different scale to report Mental Chronometry MC findings Argues for the global adoption of an absolute scale as opposed to the traditional ordinal scale An important contribution to MC researchers and psychologists and neuroscientists

Cognitive Contributions to the Perception of Spatial and Temporal

Events G. Aschersleben, T. Bachmann, J. Müsseler, 1999-11-18 The book is concerned with the cognitive contributions to perception that is with the influence of attention intention or motor processes on performances in spatial and temporal tasks The chapters deal with fundamental perceptual processes resulting from the simple localization of an object in space or from the temporal determination of an event within a series of events Chapters are based on presentations given at the Symposium on the Cognitive Contributions to the Perception of Spatial and Temporal Events September 7-9 1998 Ohlstadt Germany Following each chapter are commentary pieces from other researchers in the field At the meeting contributors were encouraged to discuss their theoretical positions along with presenting empirical results and the book's commentary sections help to preserve the spirit and controversies of the symposium The general topic of the book is split into three parts Two sections are devoted to the perception of unimodal spatial and temporal events and are accompanied by a third part on spatio-temporal processes in the domain of intermodal integration The themes of the book are highly topical There is a growing interest in studies both with healthy persons and with patients that focus on localization errors and dissociations in localizations resulting from different tasks These errors lead to new concepts of how visual space is represented Such deviations are not only observed in the spatial domain but in the temporal domain as well Typical examples are errors in duration judgments or synchronization errors in tapping tasks In addition several studies indicate the influence of attention on both the timing and on the localization of dynamic events Another intriguing question originates from well known interactions between intermodal events namely whether these events are based on a single representation or whether different representations interact
