An Operator Perspective on Signals and Systems Arthur Frazho, Wisuwat Bhosri, 2009-12-29 In this monograph we combine operator techniques with state space methods to solve factorization spectral estimation and interpolation problems arising in control and signal processing We present both the theory and algorithms with some Matlab code to solve these problems A classical approach to spectral factorization problems in control theory is based on Riccati equations arising in linear quadratic control theory and Kalman filtering One advantage of this approach is that it readily leads to algorithms in the non degenerate case On the other hand this approach does not easily generalize to the nonrational case and it is not always transparent where the Riccati equations are coming from Operator theory has developed some elegant methods to prove the existence of a solution to some of these factorization and spectral estimation problems in a very general setting However these techniques are in general not used to develop computational algorithms In this monograph we will use operator theory with state space methods to derive computational methods to solve factorization spectral estimation and interpolation problems It is emphasized that our approach is geometric and the algorithms are obtained as a special application of the theory We will present two methods for spectral factorization One method derives algorithms based on finite sections of a certain Toeplitz matrix The other approach uses operator theory to

develop the Riccati factorization method Finally we use isometric extension techniques to solve some interpolation problems
