Purpose

This Acoustical Glazing Design Guide has been prepared for the building design professional, manufacturer of Saflex protective interlayer used in laminated glass. This guide includes the most comprehensive and up-to-date collection of laboratory-tested sound transmission loss data for laminated, monolithic and air-spaced glass configurations. It is an indispensable reference for anyone concerned about sound transmission through windows.

The primary purpose of this publication is to present easy-to-follow methodologies for estimating the minimum required sound transmission loss (TL) for exterior glazing exposed to the most common sources of exterior environmental noise: aircraft, highway traffic and rail transportation. These methodologies are devised to enable the architect to explore glazing options early in project development.

The need for this planning tool is great and ever-increasing due to more extensive use of land areas close to airports, highways and rail transportation lines. This, coupled with greater building owner/user expectations for noise control and wider use of lightweight, lower-cost building materials, has heightened the importance of exterior environmental noise considerations.

Organization

To provide a "user friendly" design tool, this guide has been organized as follows:

Section 1 presents methodologies for determining the minimum required window sound transmission class (STC) rating and various glazing alternatives that will satisfy this requirement. Also included in this section are typical examples illustrating the use of these methodologies and a compilation of window STC data measured by Riverbank Acoustical Laboratories (BALTM) in tests.
