

The figure below shows the change over time in soil organic matter content.

Column	Type I, II, or III?	Description of each type	Example(s) of where it occurs
A	Type I	Organic matter levels remain relatively constant while other soil factors like climate, soil texture, and rock type change.	Loamy sand soils - USA, Australia, Europe, Russia, Mexico, Canada
B	Type II	Organic matter disappears rapidly as other factors persist despite changes in climate.	Sandy soils (USA, Australia, Europe, China, Japan)
C	Type III	Organic matter levels change rapidly as other factors change rapidly due to human activity.	Flood waters (Australia, Japan, USA)

What is caused by geopositional distribution?

The variation in soil organic matter production distribution patterns could be due to the following:

Type of distribution	Picture of this distribution	Why are these patterns?
Homogeneous		<b>HOMOGENEITY</b> Relatively constant, equal distribution, resulting from mixing by wind, water, or biological activity.
Heterogeneous		<b>HETEROGENEITY</b> Unevenly distributed, non-uniformity.
Stratified		<b>STRATIFICATION</b> Soil in different layers. Result of differences in weathering, soil formation, or previous biotic activity.
