Microorganisms in Polar Regions: Understanding Their Survival Strategies for a Sustainable Future Prashant Kumar Singh, Shiv Mohan Singh, Trista J. Vick-Majors, 2024-07-02 Scientific research on cold adapted microorganisms specifically polar microbes is of great interest since Arctic and Antarctic regions harbor diverse and active populations of microorganisms. However, these microorganisms are subject to impacts of environmental perturbations. For example, climate change will modulate the distribution and activity of many cyanobacteria and algal species in polar environments that contribute significantly to global carbon fixation and oxygen production. Moreover, many microorganisms that have remained frozen for thousands of years can revive their metabolic activity and rejoin the modern microbial community. For survival in freezing environments, polar microorganisms have established specific regulatory mechanisms which are now being challenged by new rapidly changing environmental conditions. Remarkable progress has been made to uncover microbial adaptation to anthropogenic activities such as high irradiance, nutritional deprivation, UV B radiation, heat, cold, desiccation, and heavy metals. Studies have enabled a basic understanding of gene regulatory pathways for morphological, physiological, metabolic, and genetic adaptations to various environmental stresses. To further elucidate physiological adaptation mechanisms and molecular diversity in polar regions, this Research Topic is focused on microbes in polar regions looking at their biodiversity, ecological adaptations, the impact of climate change on their lifestyles, and biotechnological application of microbes for a sustainable future.

Microbial Inoculants in Sustainable Agricultural Productivity Dhananjaya Pratap Singh, Harikesh Bahadur Singh, Ratna Prabha, 2016-03-23 The performance of crops in the soil largely depends on the physico-chemical components of the soil which regulate the availability of nutrients as well as abiotic and biotic stresses. Microbes are the integral component of any agricultural soil, playing a vital role in regulating the bioavailability of nutrients, the tolerance to abiotic and biotic stresses, and management of seed-borne and soil-borne plant diseases. The second volume of the book *Microbial Inoculants in Sustainable Agricultural Productivity: Functional Applications* reflects the pioneering efforts of eminent researchers to explore the functions of promising microbes as microbial inoculants, establish inoculants for field applications, and promote corresponding knowledge among farming communities. In this volume, readers will find dedicated chapters on the role of microbes as biofertilizers and

biopesticides in the improvement of crop plants managing soil fertility and plant health enhancing the efficiency of soil nutrients and establishing systemic phytopathogen resistance in plants as well as managing various kinds of plant stress by applying microbial inoculants The impact of microbial inoculants on the remediation of heavy metals soil carbon sequestration function of rhizosphere microbial communities and remediation of heavy metal contaminated agricultural soils is also covered in great detail In this Volume a major focus is on the approaches strategies advances and technologies used to develop suitable and sustainable delivery systems for microbial inoculants in field applications Subsequent chapters investigate the role of nanomaterials in agriculture and the nanoparticle mediated biocontrol of nematodes An overview of the challenges facing the regulation and registration of biopesticides in India rounds out the coverage

Ocean Acidification National Research Council,Division on Earth and Life Studies,Ocean Studies Board,Committee on the Development of an Integrated Science Strategy for Ocean Acidification Monitoring,2010-10-14 The ocean has absorbed a significant portion of all human made carbon dioxide emissions This benefits human society by moderating the rate of climate change but also causes unprecedented changes to ocean chemistry Carbon dioxide taken up by the ocean decreases the pH of the water and leads to a suite of chemical changes collectively known as ocean acidification The long term consequences of ocean acidification are not known but are expected to result in changes to many ecosystems and the services they provide to society Ocean Acidification A National Strategy to Meet the Challenges of a Changing Ocean reviews the current state of knowledge explores gaps in understanding and identifies several key findings Like climate change ocean acidification is a growing global problem that will intensify with continued CO2 emissions and has the potential to change marine ecosystems and affect benefits to society The federal government has taken positive initial steps by

developing a national ocean acidification program but more information is needed to fully understand and address the threat that ocean acidification may pose to marine ecosystems and the services they provide In addition a global observation network of chemical and biological sensors is needed to monitor changes in ocean conditions attributable to acidification
