Viper User Guide Owners Manual:

SIMD Programming Manual for Linux and Windows Paul Cockshott, Kenneth Renfrew, 2013-03-09 A number of widely used contemporary processors have instruction set extensions for improved performance in multi media applications. The aim is to allow operations to proceed on multiple pixels each clock cycle. Such instruction sets have been incorporated both in specialist DSP chips such as the Texas C62xx Texas Instruments 1998 and in general purpose CPU chips like the Intel IA32 Intel 2000 or the AMD K6 Advanced Micro Devices 1999. These instruction set extensions are typically based on the Single Instruction stream Multiple Data stream SIMD model in which a single instruction causes the same mathematical operation to be carried out on several operands or pairs of operands at the same time. The level of parallelism supported ranges from two floating point operations at a time on the AMD K6 architecture to 16 byte operations at a time on the Intel P4 architecture. Whereas processor architectures are moving towards greater levels of parallelism, the most widely used programming languages such as C, Java and Delphi are structured around a model of computation in which operations take place on a single value at a time. This was appropriate when processors worked this way but has become an impediment to programmers seeking to make use of the performance offered by multi media instruction sets. The introduction of SIMD instruction sets Peleg et al

Current Trends in Hardware Verification and Automated Theorem Proving Graham Birtwistle, P.A. Subrahmanyam, 2012-12-06 This report describes the partially completed correctness proof of the Viper block model. Viper 7.8.9.11.23 is a microprocessor designed by W.J. Cullyer, C. Pygott and J. Kershaw at the Royal Signals and Radar Establishment in Malvern, England, henceforth RSRE, for use in safety critical applications such as civil aviation and nuclear power plant control. It is currently finding uses in areas such as the deployment of weapons from tactical aircraft. To support safety critical applications Viper has a particularly simple design about which it is relatively easy to reason using current techniques and models. The designers who deserve much credit for the promotion of formal methods intended from the start that Viper be formally verified. Their idea was to model Viper in a sequence of decreasingly abstract levels, each of which concentrated on some aspect of the design such as the flow of control, the processing of instructions and so on. That is, each model would be a specification of the next less abstract model and an implementation of the previous model if any. The verification effort would then be simplified by being structured according to the sequence of abstraction levels. These models or levels of description were characterized by the design team. The first two levels and part of the third were written by them in a logical language amenable to reasoning and proof.
