

## Chronic Oro-Genital Ulcerations as a Presenting Feature of Chronic Eosinophilic Leukemia: A Case Report

### Abstract

Hyper eosinophilia can be primary, including idiopathic hyper eosinophilic syndrome (HES) and chronic eosinophilic leukemia, or secondary/reactive to various infective and non-infective stimuli. Chronic oro-genital ulcerations can occur due to various dermatological and non-dermatological disorders, and many times it serves as a useful indicator of an underlying systemic disorder. Hence, a case presenting with chronic oro-genital ulcerations needs a thorough evaluation. We are reporting an interesting case of a middle-aged male who had chronic oro-genital ulcerations as a presenting feature of chronic eosinophilic leukemia with *FIP1L1-PDGFR4* fusion (FIP1-like 1/platelet-derived growth factor receptor alpha). The patient's oro-genital ulcerations responded excellently to imatinib.

**Keywords:** Chronic eosinophilic leukemia, chronic oro-genital ulcerations, hyper eosinophilia, imatinib mesylate, *PDGFR4* gene re-arrangement

### Introduction

Hyper eosinophilia is defined as  $>1.5 \times 10^9$  eosinophils/L in peripheral blood. With adequate workup, if this is demonstrated on more than one occasion at an interval of a minimum of one month, it can be considered "persistent". If the patient does not have any signs and symptoms, then the duration of the interval should be considered as 6 months.<sup>[1]</sup> Hyper eosinophilia can be primary, including idiopathic hyper eosinophilic syndrome (HES) and chronic eosinophilic leukemia, or secondary/reactive to various infective and non-infective stimuli.<sup>[2]</sup> Clonal myeloid neoplasms with eosinophilia are divided into three categories: (1) myeloid/lymphoid neoplasms with eosinophilia and rearrangements of *PDGFR4* (platelet-derived growth factor receptor alpha), *PDGFRB* (beta), *FGFR1* (fibroblast growth factor receptor 1) or provisionally *PCML-JAK2* translocation; (2) hyper eosinophilia associated with another well-defined myeloid neoplasm, such as chronic myeloid leukemia (CML); and (3) chronic eosinophilic leukemia (CEL) not otherwise specified (NOS).<sup>[1]</sup> Chronic oro-genital ulceration with pain can be caused by various diseases.<sup>[3]</sup> We report a case of

a middle-aged male who had chronic recurrent oro-genital ulcerations and was eventually diagnosed to have CEL with *FIP1L1-PDGFR4* fusion.

### Case Report

A 36-year-old male presented with complaints of painful genital ulcers for 6 months and oral ulceration for 3 months. He had a history of tobacco chewing for the last 20 years. He had been treated for Behcet's disease and connective tissue disease with various immunosuppressive drugs including steroids, colchicine, dapsone, etc., but had no improvement. The patient had multiple superficial mucosal erosions of variable size with irregular borders and surrounding erythematous rim over the tip of the tongue, buccal mucosa, hard palate, soft palate, and over glans penis [Figure 1a and b]. His ophthalmological examination was normal. Pathergy test was negative. His previous biopsy specimen from oral mucosa demonstrated features of epithelial ulcers with chronic lymphocytic infiltrate, plasma cells and few neutrophils [Figure 2a]. As the morphology of ulcers was intriguing, we investigated the case further to rule out any systemic disease and nutritional deficiencies. He was found to have anemia,
