Ultra Low Power Transceiver for Wireless Body Area Networks Jens Masuch,Manuel Delgado-Restituto,2013-03-28 Wireless Body Area Networks

WBANs are expected to promote new applications for the ambulatory health monitoring of chronic patients and elderly population aiming to improve their quality of life and independence. These networks are composed by wireless sensor nodes (WSNs) used for measuring physiological variables e.g. glucose level in blood or body temperature or controlling therapeutic devices e.g. implanted insulin pumps. These nodes should exhibit a high degree of energy autonomy in order to extend their battery lifetime or even make the node supply to rely on harvesting techniques. Typically the power budget of WSNs is dominated by the wireless link and hence many efforts have been directed during the last years toward the implementation of power efficient transceivers. Because of the short range typically no more than a few meters and low data rate typically in between 10 kb/s and 1 Mb/s simple communication protocols can be employed. One of these protocols specifically tailored for WBAN applications is the Bluetooth low energy (BLE) standard. This book describes the challenges and solutions for the design of ultra low power transceivers for WBANs applications and presents the implementation details of a BLE transceiver prototype. Coverage includes not only the main concepts and architectures for achieving low power consumption but also the details of the circuit design and its implementation in a standard CMOS technology.

Artificial Transmission Lines for RF and Microwave Applications Ferran Martín, 2015-07-01. This book presents and discusses alternatives to ordinary transmission lines for the design and implementation of advanced RF/microwave components in planar technology. This book is devoted to the analysis, study and applications of artificial transmission lines mostly implemented by means of a host line conveniently modified e.g. with modulation of transverse dimensions with etched patterns in the metallic layers etc. or with reactive loading in order to achieve novel device functionalities, superior performance and/or reduced size. The author begins with an introductory chapter dedicated to the fundamentals of planar transmission lines. Chapter 2 is focused on artificial transmission lines based on periodic structures including non-uniform transmission lines and reactively loaded lines and provides a comprehensive analysis of the coupled mode theory. Chapters 3 and 4 are dedicated to artificial transmission lines inspired by metamaterials or based on metamaterial concepts. These chapters include the main practical implementations of such lines and their circuit models and a wide overview of their RF/microwave applications including passive and active circuits and antennas. Chapter 5 focuses on reconfigurable devices based on tunable artificial lines and on non-linear transmission lines. The chapter also introduces several materials and components to achieve tuning including diode varactors, RF MEMS, ferroelectrics and liquid crystals. Finally, Chapter 6 covers other advanced transmission lines and wave guiding structures such as electroinductive, magnetoinductive wave lines.
