Omics in Seed Development: Challenges and Opportunities for Improving of Seed Quality and Yield in Model and Crop Plants Daoquan Xiang,Zhaorong Hu ,Raju Datla,2025-03-06 Seed development represents an important phase of the life cycle in sexually reproducing plant species A seed is a complex organ system of three components the embryo that contributes to germline continuity endosperm for nourishment and the seed coat for protection The developmental programs and the associated events that culminate in the production of a mature seed are highly complex and require precisely coordinated integration of the genetic molecular biochemical metabolic and physiological pathways and their interactions with environmental cues Research advances in seed development using model and crop species such as Arabidopsis rice maize wheat and Brassica species have uncovered several key genes and pathways that regulate the cell and tissue specification differentiation and growth programs The key findings from these studies are helping to develop a framework for advancing the knowledge and understanding of the process and the underpinning molecular mechanisms of an embryo endosperm and seed coat development However knowledge gaps still exist in understanding the regulating networks and metabolic programs involved in defining several important seed traits associated with seed quality and yield especially in crop plants Continued rapid advances in omics technologies have contributed to the development of several critical tools for performing genome epigenome transcriptome proteome and metabolome studies and their applications in seed development Bioinformatics and computational tools are also playing important contributions in the large scale genome wide systems level analysis modeling and predictions to identify and characterize the underpinning mechanisms that support seed formation A holistic understanding of the complexities and interactions that drive seed development is becoming increasingly possible with the application of omics tools to decipher gene protein and metabolite networks In the proposed Research Topic we highlight current advances in genomics proteomics lipidomics metabolomics metagenomics transcriptomics and phenomics studies of seed development in both model and crop species We aim to further elucidate how these key genetic regulators and pathway genes act together to control cell division patterning differentiation and storage reserve accumulation during seed development how these critical processes coordinate to define the seed as a whole and how the genetic and regulatory networks function to generate tremendous natural diversity in the size number and compositional aspects of plant seeds
