### **TEK 8.11C: Effects of Environmental Change**

**TEK 8.11C: Explore how short- and long-term environmental changes affect organisms and traits in subsequent populations.**

- The biomes and ecosystems of Earth are not unchanging and static. Even without interference by humans, ecosystems constantly undergo change. If plant and animal species are to survive this change, they must adapt. The adaptation process, covered in Tutorial 52: *Natural Selection*, allows for the continuation of life on Earth.
- Environmental change can either be short-term, occurring in only a few months or years, or long-term, occurring over hundreds, thousands or even millions of years. The slower the change, the easier it is for living organisms to adapt.
- The causes of environmental change can either be natural or human-created. It is often difficult to determine why any single environmental change occurs, and even harder to understand the causes of large-scale ecological change. Global changes such as "global warming" or "climate change" are likely caused by a combination of natural and human causes.

### **Natural Environmental Change**

- Short-term natural environmental change may be caused by catastrophic events such as large volcanic eruptions, earthquakes, tsunamis, small asteroid or comet impacts, and natural climate events and cycles, such as large hurricanes (also called typhoons or cyclones), periodic floods and droughts, and the El Niño and La Niña global weather cycles.
  - **Large volcanic eruptions** can put so much volcanic ash and dust into the atmosphere that it lowers the average temperature of Earth's surface by several degrees. This can lead to several years with longer winters or shorter growing seasons, causing drops in human and animal populations. Volcanic eruptions can also cause mudflows (lahars) which can destroy river valley ecosystems within 100 kilometers of the volcano, and destroy all life within 25 kilometers of the volcano. Extremely large volcanic eruptions, such as the Yellowstone Caldera eruption about 640,000 years ago, can bury large areas in volcanic ash, destroying most life in the area for many decades. See Tutorial 44: *Succession* for a description of the primary succession process that would rebuild the ecosystem after a volcanic eruption.
  - **Earthquakes** can cause landslides and shifts in ground level, altering the course of rivers or flooding large areas. Earthquakes that occur in ocean subduction zones can cause underwater landslides that create **tsunamis**, large waves that can destroy coastal ecosystems and human development.
