

# Process of Mitosis

Mitosis is the process by which a cell divides and replicates its DNA, resulting in two genetically identical daughter cells. During mitosis, the chromosomes in the cell nucleus condense and the nuclear envelope breaks down.

The chromosomes are then separated by the spindle fibers and pulled to opposite sides of the cell. Finally, the cell divides, forming two new nuclei with identical genetic information. This process is necessary for tissue growth and repair in multicellular organisms.

## Mitosis – Interphase

Interphase: The stage of the cell cycle that occurs before mitosis.

## Mitosis – Prophase

Prophase: Chromosomes condense and become visible. The nuclear envelope breaks down.

## Mitosis – Metaphase

Metaphase: Chromosomes align at the center of the cell.

## Mitosis – Anaphase

Anaphase: The chromosomes are pulled apart by spindle fibers to opposite sides of the cell.

## Mitosis – Telophase

Telophase: The chromosomes decondense and a new nuclear envelope forms around each set of chromosomes. The cell then divides through cytokinesis to form two identical daughter cells.

## Mitosis – Telophase

Telophase: The chromosomes decondense and a new nuclear envelope forms around each set of chromosomes. The cell then divides through cytokinesis to form two identical daughter cells.
