Geometry and Thermodynamics J.C. Tolédano, 2012-12-06 Distinct scientific communities are usually involved in the three fields of quasi crystals, of liquid crystals and of systems having modulated crystalline structures. However, in recent years there has been a growing feeling that a number of common problems were encountered in the three fields. These comprise the need to recur to exotic spaces for describing the type of order of the atomic or molecular configurations of these systems, Euclidian superspaces of dimensions greater than 3 or 4, dimensional curved spaces, the recognition that one has to deal with geometrically frustrated systems and also the occurrence of specific excitations, static or dynamic, resulting from the continuous degeneracies of the stable structures considered. In the view of discussing these problems, a NATO Advanced Research Workshop has assembled in Preveza, Greece, in September 1989. 50 experts of the three considered fields, with an equal proportion of theorists and experimentalists, 35 hours of conferences and discussions have led to a more detailed evaluation of the similarities and of the differences in the approaches implemented in the studies of the three types of systems. The papers contained in this NATO series book provide the substance of this workshop. The reader will find three types of papers: Some very short papers giving the main ideas stated on a subject; Papers comprising 8-10 pages which stick closely to the contents of the talks presented; Longer papers providing more extensively the background and results relative to a given topic. It is worth summarizing the principal outputs of the workshop.

Effective Non-Hermiticity and Topology in Markovian Quadratic Bosonic Dynamics Vincent Paul Flynn, 2024-04-18 This thesis provides an in depth investigation of effective non Hermiticity and topology in many mode non interacting bosonic systems. It also establishes the extent to which one must move beyond the Hamiltonian closed system setting in order to uncover signatures of genuine symmetry protected topological SPT physics in free mean field bosons. While SPT phases of free fermionic matter and their associated zero energy boundary localized modes have been thoroughly explored, similar physics in free bosonic systems still remains elusive. No fermionic counterpart exists for the distinctive dynamical behavior that arises

from the effective non Hermiticity intrinsic even at equilibrium to bosonic Hamiltonians Therefore a much needed paradigm shift is required to address major conceptual roadblocks in the search for SPT bosonic phases The analysis within develops in particular the notion of topological metastability in quadratic bosonic systems subject to Markovian dissipation The resulting dynamical paradigm was found to be characterized by both a sharp separation between transient and asymptotic dynamics and non trivial topological invariants It also features long lived boundary localized Majorana boson and Dirac boson modes which realize tight bosonic analogues to the edge modes characteristic of fermionic SPT phases This comprehensive look into non interacting bosonic systems breaks important new ground for re imagining quantum phenomena beyond equilibrium with novel applications in quantum science
