Röhrbein, Germano Veiga, Ciro Natale, 2013-10-11 This monograph by Florian Röhrbein, Germano Veiga and Ciro Natale is an edited collection of 15 authoritative contributions in the area of robot technology transfer between academia and industry. It comprises three parts on Future Industrial Robotics, Robotic Grasping as well as Human Centered Robots. The book chapters cover almost all the topics nowadays considered hot within the robotics community from reliable object recognition to dexterous grasping from speech recognition to intuitive robot programming from mobile robot navigation to aerial robotics from safe physical human robot interaction to body extenders. All contributions stem from the results of ECHORD, the European Clearing House for Open Robotics Development, a large scale integrating project funded by the European Commission within the 7th Framework Programme from 2009 to 2013. ECHORD's two main pillars were the so called experiments: 52 small sized industry driven research projects and the structured dialog, a powerful interaction instrument between the stakeholders. The results described in this volume are expected to shed new light on innovation and technology transfer from academia to industry in the field of robotics.

Screw Theory in Robotics Jose Pardos-Gotor, 2021-11-23 Screw theory is an effective and efficient method used in robotics applications. This book demonstrates how to implement screw theory explaining the key fundamentals and real world applications using a practical and visual approach. An essential tool for those involved in the development of robotics implementations, the book uses case studies to analyze mechatronics. Screw theory offers a significant opportunity to interpret mechanics at a high level facilitating contemporary geometric techniques in solving common robotics issues. Using these solutions results in an optimized performance in comparison to algebraic and numerical options. Demonstrating techniques such as six dimensional 6D vector notation and the Product of Exponentials (POE), the use of screw theory notation reduces the need for complex algebra which results in simpler code which is easier to write, comprehend and debug. The book provides exercises and simulations to demonstrate this with new formulas and algorithms presented to aid the reader in accelerating their learning. By walking the user through the fundamentals of screw theory and by providing a complete set of examples for the most common robot manipulator architecture, the book delivers an excellent foundation through which to comprehend screw theory developments. The visual approach of the book means it can be used as a self learning tool for professionals alongside students. It will be of interest to those studying robotics, mechanics, mechanical engineering and electrical engineering.

in the field is presented in the introductory chapter. It covers the various types of nanorobotic systems, their applications and future directions in this field. The volume is divided into three themes related to medical applications. The first theme describes the main challenges of microrobotic design for propulsion in vascular media. Such nanoscale robotic agents are envisioned to revolutionize medicine by enabling minimally invasive diagnostic and therapeutic procedures. To be useful, nanorobots must be operated in complex biological fluids and tissues which are often difficult to penetrate. In this section, a collection of four papers reviews the potential medical applications of motile nanorobots, catalytic based propelling agents, biologically inspired microrobots, and nanoscale bacteria enabled autonomous drug delivery systems. The second theme relates to the use of micro and nanorobots inside the body for drug delivery and surgical applications. A collection of six chapters is presented in this segment. The first chapter reviews the different robot structures for three different types of surgery: namely laparoscopy, catheterization, and ophthalmic surgery. It highlights the progress of surgical microrobotics toward intracorporeally navigated mechanisms for ultra minimally invasive interventions. Then, the design of different magnetic actuation platforms used in micro and nanorobotics are described. An overview of magnetic actuation based control methods for microrobots with eventually biomedical applications is also covered in this segment. The third theme discusses the various nanomanipulation strategies that are currently used in biomedicine for cell characterization, injection, fusion, and engineering. In vitro 3D cell culture has received increasing attention since it has been discovered to provide a better simulation environment of in vivo cell growth. Nowadays, the rapid progress of robotic technology paves a new path for the highly controllable and flexible 3D cell assembly. One chapter in this segment discusses the applications of micro/nano robotic techniques for 3D cell culture using engineering approaches. Because cell fusion is important in numerous biological events and applications such as tissue regeneration and cell reprogramming, a chapter on robotic tweezers/cell manipulation system to achieve precise laser induced cell fusion using optical trapping has been included in this volume. Finally, the segment ends with a chapter on the use of novel MEMS based characterization of micro scale tissues instead of mechanical characterization for cell lines studies.
