ECG Based Analysis of the Ventricular Repolarisation in the Human Heart Baas, Tobias, 2012-08-06 ECG recordings provide diagnostic relevant information on the de and repolarisation sequences of the heart A modification of the repolarisation sequence is assumed to cause Torsades de Pointes Especially drug induced effects on the repolarisation processes are in focus since some non cardiac drugs have been associated with sudden cardiac death in the 1990s The analysis of the ventricular repolarisation using a set of parameters depicting the morphology of the T wave is introduced in this work Therefore new methods of fully automatic patient specific QRS detection beat classification and precise T wave delineation are presented Using these methods medical studies are investigated regarding the modification of the T wave by different compounds Also the impact of the heart rate on the morphology of the T wave is part of this research The reliable identification of ventricular ectopic beats allows an analysis of

the influence of these beats on subsequent heart beats It turned out that the morphology of subsequent heart beats can significantly be changed This might give new information on the proarrhythmic risk of ventricular ectopic beats **Drug**

Discovery and Evaluation: Safety and Pharmacokinetic Assays Franz J. Hock, Michael K. Pugsley, 2024-10-21 Many aspects of drug safety have become an outstanding and even persistent issue and may occur during the process of both drug discovery and development Until 15 years ago drug discovery and evaluation was primarily a sequential process starting with the selection of the most pharmacologically active compound from a series of newly synthesized small molecule chemical series by means of distinctive pharmacological assays Safety aspects were addressed by evaluation of the selected compound at high doses in a series of specific studies directed at indications other than the intended indication of the new compound These tests are then followed by pharmacokinetic studies which are primarily conducted to confirm whether the selected compound possesses a suitable half life for sufficient exposure and efficacy and whether it has the desired properties specificity to the intended route of administration Safety aspects relied predominantly on the conduct of single and repeat toxicology dose studies which inform changes in organ structure rather than organ function Both toxicological and pharmacokinetic studies are adapted to the progress of studies in clinical pharmacology and clinical trials The new edition of this well and broadly accepted reference work contains several innovative and distinguished chapters This sequential strategy has been abandoned with this new version of the book for several reasons Of the possible multitude of negative effects that novel drugs may impart on organ function e.g. ventricular tachyarrhythmia many are detected too late in non clinical studies to inform clinicians On the other hand negative findings in chronic toxicity studies in animals may turn out to be irrelevant for human beings New scientific approaches e.g. high throughput screening human pluripotent stem cells transgenic animals knock out animals in silico models pharmacogenomics and pharmacoproteomics as well as Artificial Intelligence AI methods offered new possibilities There are several examples that show that the druggability of compounds was considerably underestimated when the probability of success of a new project was assessed The success rate in the pharmaceutical industry and the introduction of new chemical entities to the market per year dropped dramatically whereas the development time for a new compound increased sometimes exceeding the patent protection Research and development scientists involving the following changes therefore adopted a change of strategy Parallel instead of sequential involvement of the various disciplines multidimensional compound optimization The term Safety Pharmacology was coined The International Conference on Harmonization ICH founded a Safety Pharmacology Working Group and the Safety Pharmacology Society SPS was launched The discipline provided for evaluation development and validation of a multitude of safety tests outlined in the Core Battery of Studies Characterizing the exposure profile of a drug by conducting pharmacokinetic studies that evaluates the absorption distribution metabolism and excretion should to be investigated at an early stage of development as results contribute to the selection of a compound for further development Advancements in

Toxicology were achieved by the introduction of new methods e g in silico methods genetic toxicology computational toxicology and AI The book is a landmark in the continuously changing world of drug research and developments As such it is essential reading for many groups not only for all students of pharmacology and toxicology but also for industry scientists and physicians especially those involved in clinical trials of drugs and for pharmacists who must know the safety requirements of drugs The book is essential for scientists and managers in the pharmaceutical industry who are involved in drug discovery drug development and decision making in the development process In particular the book will be of use to government institutions and committees working on official guidelines for drug evaluation worldwide Biomarker

Validation Harald Seitz,Sarah Schumacher,2015-02-23 Built on a decade of experience with novel molecular diagnostics this practice oriented guide shows how to cope with validation issues during all stages of biomarker development from the first clinical studies to the eventual commercialization of a new diagnostic test Statistical Methods in Biomarker and Early Clinical Development Liang Fang,Cheng Su,2019-12-26 This contributed volume offers a much needed overview of the statistical methods in early clinical drug and biomarker development Chapters are written by expert statisticians with extensive experience in the pharmaceutical industry and regulatory agencies Because of this the data presented is often accompanied by real world case studies which will help make examples more tangible for readers The many applications of statistics in drug development are covered in detail making this volume a must have reference Biomarker development and early clinical development are the two critical areas on which the book focuses By having the two sections of the book dedicated to each of these topics readers will have a more complete understanding of how applying statistical methods to early drug development can help identify the right drug for the right patient at the right dose Also presented are exciting applications of machine learning and statistical modeling along with innovative methods and state of the art advances making this a timely and practical resource This volume is ideal for statisticians researchers and professionals interested in pharmaceutical research and development Readers should be familiar with the fundamentals of statistics and clinical trials

Clinical Trial Simulations Holly H. C. Kimko, Carl C. Peck, 2010-12-09 This edition includes both updates and new uses and issues concerning CTS along with case studies of how clinical trial simulations are being applied in various therapeutic and application areas. Importantly, the book expands on the utility of CTS for informing decisions during drug development and regulatory review. Each chapter author was selected on the basis of demonstrated expertise in state of the art application of CTS. The target audience for this volume includes researchers and scientists who wish to consider use of simulations in the design, analysis or regulatory review and guidance of clinical trials. This book does not embrace all aspects of trial design nor is it intended as a complete recipe for using computers to design trials. Rather, it is an information source that enables the reader to gain understanding of essential background and knowledge for practical applications of simulation for clinical trial design and analysis. It is assumed that the reader has a working understanding of pharmacokinetics and pharmacodynamics, modeling, pharmacometric analyses and/or the drug development and regulatory processes.
