The Philosophy of Computer Science

First published Fri Dec 12, 2008

The Philosophy of Computer Science (**PCS**) is concerned with philosophical issues that arise from reflection upon the nature and practice of the academic discipline of computer science. But what is the latter? It is certainly not just programming. After all, many people who write programs are not computer scientists. For example, physicists, accountants and chemists do. Indeed, computer science would be better described as being concerned with the meta-activity that is associated with programming. More generally, and more precisely, it is occupied with the design, development and investigation of the concepts and methodologies that facilitate and aid the specification, development, implementation and analysis of computational systems. Examples of this activity might include the design and analysis of programming, specification and architectural description languages; the construction and optimisation of compilers, interpreters, theorem provers and type inference systems; the invention of logical frameworks and the design of embedded systems, and much more. Many of the central philosophical questions of computer science surround and underpin these activities, and many of them centre upon the logical, ontological and epistemological issues that concern it. However, in the end, computer science is what computer scientists do, and no exact formulaic definition can act as more than a guide to the discussion that follows. Indeed, the hope is that **PCS** will eventually contribute to a deeper understanding of the nature of computer science.

But mapping out the philosophical landscape of computer science is no easy task. Fortunately, traditional branches of philosophy can provide intellectual and structural guidance. For example, in the philosophies of mathematics and physics, there are central questions concerning the nature of the objects dealt with, what constitutes knowledge and the means of obtaining that knowledge. The philosophy of language raises questions about the content and form of a semantic theory for natural language. It brings to the fore the underlying ontological and epistemological assumptions of the semantic enterprise. Ontology indicates the kinds of things there are, how to individuate them and their role in framing our conceptual schemes. The philosophy of logic provides an account and analysis of different kinds of logical systems and their role in everyday and specialized discourse. Analogies and similarities from these and other branches of philosophy should prove helpful in identifying and clarifying some of the central philosophical concerns of computer science. The existing influence of these disciplines on **PCS** will emerge as we proceed. In particular, the second, third and fourth sections will reflect the impact of ontology and the philosophies of language and mathematics.
