

PHLEBOTOMY

STUDY GUIDE

Preparation: Verify the patient's identity using two identifiers. Explain the procedure to the patient to obtain consent and ensure they're comfortable. Assemble all necessary equipment: gloves, alcohol swabs, tourniquet, appropriate needles, collection tubes, and band-aids. **Step 1:** Select site. Place the tourniquet about 3-4 inches above the selected puncture site. Assess the patient's arm for a suitable vein; the median cubital vein is often the first choice due to its size and stability. Look for veins that are visible, palpable, and have a bouncy feel when pressed.

ORDER OF DRAW

Order of Draw: Follow the correct order of draw to prevent cross-contamination of additives between tubes: Blood cultures, coagulation tube (light blue), serum tubes with or without clot activator (red or gold), heparin tubes (green), EDTA tubes (purple), and glycolytic inhibitor tubes (gray).

Procedure: Clean the puncture site with an alcohol swab in a circular motion, starting at the center and moving outward. Perform the venipuncture at a 15-30 degree angle with the barrel of the needle facing upward. Once blood flow is established, fill and change tubes as needed, maintaining the order of draw. Release the tourniquet before removing the needle. Apply pressure to the site after removing the needle to stop bleeding. Post-procedure: Properly label all tubes with the patient's information and the date/time of collection. Dispose of sharps immediately in a sharps container.

Thank the patient and provide any necessary aftercare instructions. **Safety and Compliance:** Always wear gloves and practice standard precautions to prevent exposure to bloodborne pathogens. Ensure proper disposal of all used materials according to guidelines. This cheat sheet highlights critical steps and considerations in phlebotomy, serving as a quick review to promote safe and effective practice. Always adhere to the specific protocols of your institution or laboratory.
