The semantics of English -ment nominalizations, 2023-06-02 It is well known that derivational affixes can be highly polysemous producing a range of different often related meanings For example English deverbal nouns with the suffix er can denote instruments opener agents writer locations diner or patients loaner It is commonly assumed that this polysemy arises through a compositional process in which the affix interacts with the semantics of the base Yet despite intensive research in recent years a workable model for this interaction is still under debate In order to study and model the semantic contributions of the base and of the affix a framework is needed in which meanings can be composed and decomposed In this book I formalize the semantic input and output of derivation by means of frames that is recursive attribute value structures that serve to model mental representations of concepts In my approach the input frame offers an array of semantic elements from which an affix may select to construct the derivative s meaning The relationship between base and derivative is made explicit by integrating their respective frame semantic representations into lexical rules and inheritance hierarchies I apply this approach to a

qualitative corpus study of the productive relationship between the English nominalizing suffix *ment* and a semantically delimited set of verbal bases. My data set consists of 40 neologisms with base verbs from two semantic classes namely change of state verbs and verbs of psychological state. I analyze 369 attestations which were elicited from various corpora with a purposeful sampling approach and which were hand coded using common semantic categories such as event state patient and stimulus. My results show that *ment* can target a systematically restricted set of elements in the frame of a given base verb. It thereby produces a range of possible readings in each derivative which becomes ultimately interpretable only within a specific context. The derivational process is governed by an interaction of the semantic elements provided by the base on the one hand with properties of the affix e.g. *ment*'s aversion to animate readings on the other. For instance a shift from the verb *annoy* to a result state reading in *annoyment* is possible because the input frame of verbs of psychological state offers a RESULT STATE attribute which as is fixed in the inheritance hierarchy is compatible with *ment*. Meanwhile a shift from *annoy* to an experiencer reading in *annoyment* fails because the value range of the attribute EXPERIENER is fixed to animate entities so that *ment*'s animacy constraint blocks the inheritance mechanism. Furthermore a quantitative exploration of my data set reveals a likely blocking effect for some *ment* readings. Thus while I have found most expected combinations of nominalization and reading attested there are pronounced gaps for readings like instrument or stimulus. Such readings are likely to be produced by standardly subject denoting suffixes such as *er* or *ant* which may reduce the probability for *ment* derivation. The quantitative analysis furthermore shows that within the subset of attested combinations ambiguity is widespread with 43% of all combinations of nominalization and reading being only attested ambiguously. This book shows how a derivational process acts on the semantics of a given verbal base by reporting on an in depth qualitative study of the semantic contributions of both the base and the affix. Furthermore it demonstrates that an explicit semantic decomposition of the base is essential for the analysis of the resulting derivative's semantics.

Cognition and Interaction: From Computers to Smart Objects and Autonomous Agents Amon Rapp, Maurizio Tirassa, Tom Ziemke, 2019-10-10 Cognitive sciences have been involved under numerous accounts to explain how humans interact with technology as well as to design technological instruments tailored to human needs. As technological advancements in fields like wearable and ubiquitous computing, virtual reality, robotics and artificial intelligence are presenting novel modalities for interacting with technology, there are opportunities for deepening, exploring and even rethinking the theoretical foundations of human technology use. This volume entitled *Cognition and Interaction: From Computers to Smart Objects and Autonomous Agents* is a collection of articles on the impacts that novel technologies are producing on individuals. It puts together 17 works spanning from research on social cognition in human robot interaction to studies on neural changes triggered by Internet use that tackle relevant technological and theoretical issues in human computer interaction, encouraging us to rethink how we conceptualize technology, its use and development.

The volume addresses fundamental issues at different levels The first part revolves around the biological impacts that technologies are producing on our bodies and brains The second part focuses on the psychological level exploring how our psychological characteristics may affect the way we use understand and perceive technology as well as how technology is changing our cognition The third part addresses relevant theoretical problems presenting reflections that aim to reframe how we conceptualize ourselves technology and interaction itself Finally the last part of the volume pays attention to the factors involved in the design of technological artifacts providing suggestions on how we can develop novel technologies closer to human needs Overall it appears that human computer interaction will have to face a variety of challenges to account for the rapid changes we are witnessing in the current technology landscape
