How do light-dependent and light-independent reactions provide food for a plant?

## Why?

Plants are the original solar panels. Through photosynthesis a plant is able to convert electromagnetic (light) energy into chemical energy. This energy is used not only to keep the plant alive, but also to sustain all creatures that rely on the plant for food and shelter. Plants and photosynthetic algae are also the source of all oxygen on Earth, allowing the inhabitants of Earth to benefit from our most plentiful renewable energy resource.

## Model 1 – Chloroplast

1. Consider the organelle illustrated in Model 1.
  - a. What is the name of this organelle?  
A chloroplast
  - b. Is this organelle more likely to be found in animal cells or plant cells?  
Plant cell
2. The structures inside the organelle in Model 1 are called thylakoids. What compound necessary for photosynthesis is contained in the thylakoids?  
Chlorophyll

Mayo, 1970      **Plant Respiration: Metabolic Fluxes and Carbon Balance** Guillaume Tcherkez, Jaleh Ghashghaie, 2018-02-20 There are currently intense efforts devoted to understand plant respiration from genes to ecosystems and its regulatory mechanisms this is because respiratory CO<sub>2</sub> production represents a substantial carbon loss in crops and in natural ecosystems Thus in addition to manipulating photosynthesis to increase plant biomass production minimization of respiratory loss should be considered in plant science and engineering However respiratory metabolic pathways are at the heart of energy and carbon skeleton production and therefore it is an essential component of carbon metabolism sustaining key processes such as photosynthesis The overall goal of this book is to provide an insight in such interactions as well as an up to date view on respiratory metabolism taking advantage of recent advances and concepts from fluxomics to natural isotopic signal of plant CO<sub>2</sub> efflux It is thus a nonoverlapping complement to Volume 18 in this series Plant Respiration From Cell to Ecosystem which mostly deals with mitochondrial electron fluxes and plant scale respiratory losses      **Photosynthesis and Respiration** Lisa Dannewitz Martineau, 2005      **Plant Respiration** Hans Lambers, Universitat Illes Balears, 2005-07-05 Respiration in plants as in all living organisms is essential to provide metabolic energy and carbon skeletons for growth and maintenance As such respiration is an essential component of a plant's carbon budget Depending on species and environmental conditions it consumes 25-75% of all the carbohydrates produced in photosynthesis even more at extremely slow growth rates Respiration in plants can also proceed in a manner that produces neither metabolic energy nor carbon

skeletons but heat This type of respiration involves the cyanide resistant alternative oxidase it is unique to plants and resides in the mitochondria The activity of this alternative pathway can be measured based on a difference in fractionation of oxygen isotopes between the cytochrome and the alternative oxidase Heat production is important in some flowers to attract pollinators however the alternative oxidase also plays a major role in leaves and roots of most plants A common thread throughout this volume is to link respiration including alternative oxidase activity to plant functioning in different environments *Advances in Photosynthesis and Respiration*, 2001 **Photosynthesis & Respiration** Cathrine M.
