Cell Cycle and Cell Differentiation J. Reinert, H. Holtzer, 2013-06-29

It is instructive to compare the response of biologists to the two themes that comprise the title of this volume The concept of the cell cycle in contra distinction to cell division is a relatively recent one Nevertheless biologists of all persuasions appreciate and readily agree on the central problems in this area Issues ranging from mechanisms that initiate and integrate the synthesis of chromosomal proteins and DNA during S phase of mitosis to the manner in which assembly of microtubules and their interactions lead to the segregation of metaphase chromosomes are readily followed by botanists and zoologists as well as by cell and molecular biologists These problems are crisp and well defined The current state of cell differentiation stands in sharp contrast This one of the oldest problems in experimental biology almost defies definition today The difficulties arise not only from a lack of pertinent information on the regulatory mechanisms but also from conflicting basic concepts in this field One of the ways in which this situation might be improved would be to find a broader experimental basis including a better understanding of the relationship between the cell cycle and cell differentiation

Cell Cycle in Development Jacek Z. Kubiak, 2011-06-01

This book focuses on the intersection between cell cycle regulation and embryo development Specific modifications of the canonical cell cycle occur throughout the whole period of development and are adapted to fulfil functions coded by the developmental program Deciphering these adaptations is essential to comprehending how living organisms develop The aim of this book is to review the best known modifications and adaptations of the cell cycle during development The first chapters cover the general problems of how the cell cycle evolves while consecutive chapters guide readers through the plethora of such phenomena The book closes with a description of specific changes in the cell cycle of neurons in the senescent human brain Taken together the chapters present a panorama of species from worms to humans and of

Guidet,S.V. Meijerink,H.Y.L. Tung,2012-12-06 Progress in Cell Cycle Research is a new annual series designed to be the source for up to date research on this rapidly expanding field Review articles by international experts examine various aspects of cell division regulation from fundamental perspectives to potential medical applications Researchers as well as advanced undergraduate and graduate students in cell biology biochemistry and molecular biology will benefit from this series [The Mitotic Exit Network](#) Fernando Monje-Casas,Ethel Queralt,2016 This detailed book collects the main methodologies used for the analysis of the activity localization and regulation of the components of the Mitotic Exit Network MEN pathway during mitotic exit in *Saccharomyces cerevisiae* as well as for the evaluation of the roles of these proteins in other cellular processes such as the condensation of the rDNA the functionality of the mitotic checkpoints and cytokinesis Budding yeast serves as an ideal model system for dissecting the mechanisms that regulate cell cycle progression and providing new insights into the molecular basis of cell cycle control and thus into the origin of diseases that arise as a consequence of problems during cell division Therefore although this volume concentrates on *Saccharomyces cerevisiae* as a model it also details the implications that the research about the MEN have on our understanding of the mitotic exit process in higher eukaryotes Written for the highly successful Methods in Molecular Biology series chapters include introductions to their respective topics lists of the necessary materials and reagents step by step readily reproducible laboratory protocols and tips on troubleshooting and avoiding known pitfalls Authoritative and practical The Mitotic Exit Network Methods and Protocols will be a valuable reference for cellular and molecular biologists and biochemists as well as for all scientists interested in the study of the regulation of mitotic exit using budding yeast as a model organism OCLC *Cell Cycle Control* Tim Humphrey,Gavin Brooks,2008-02-04 The fundamental question of how cells grow and divide has perplexed biologists since the development of the cell theory in the mid 19th century when it was recognized by Virchow and others that all cells come from cells In recent years considerable effort has been applied to the identification of the basic molecules and mechanisms that regulate the cell cycle in a number of different organisms Such studies have led to the elucidation of the central paradigms that underpin eukaryotic cell cycle control for which Lee Hartwell Tim Hunt and Paul Nurse were jointly awarded the Nobel Prize for Medicine and Physiology in 2001 in recognition of their seminal contributions to this field The importance of understanding the fundamental mechanisms that modulate cell division has been reiterated by relatively recent discoveries of links between cell cycle control and DNA repair growth cellular metabolism development and cell death This new phase of integrated cell cycle research provides further challenges and opportunities to the biological and medical worlds in applying these basic concepts

to understanding the etiology of cancer and other proliferative diseases

Nuclear-Cytoplasmic Interactions in the Cell Cycle Gary Whitson, 2012-12-02

Nuclear Cytoplasmic Interactions in the Cell Cycle *The Role of TEM4 in Cell Cycle Progression* Diogjena Prifti, 2023

The intricate process of eukaryotic cell division relies heavily on the meticulous organization and regulation of various cellular components such as the microtubules and the actin based cortex. Proper coordination between these two structures is essential during cell division as failure to do so can result in aneuploidy. The role of microtubules is central to cell division particularly during mitosis. When cells enter mitosis they undergo a rapid and dynamic remodeling process during which the interphase microtubules disassemble and give rise to shorter more dynamic microtubules emanating from centrosomes. Once Nuclear Envelope Breakdown (NEBD) occurs these microtubules extend and reach the chromosomes forming a bipolar spindle in the midzone of which captured chromosomes will align. Upon achieving proper orientation and satisfying the spindle assembly checkpoint cells enter anaphase during which the chromosomes separate. The importance of the actin cytoskeleton during the process of mitosis is widely recognized. Mitotic entry is characterized by the retraction of the cell margin followed by the rounding up of the cell and the formation of the mitotic spindle. CDK1 Cyclin B activation and subsequent translocation into the nucleus are required for this process to occur. Upon activation of the complex and its translocation to the nucleus there is a loss of cellular adhesion followed by cell rounding up culminating in mitotic entry. The geometry of cell adhesion can also impact the position of the mitotic spindle and the memory of cellular events between cell generations highlighting the significance of the actin cytoskeleton to the mitotic entry process. While changes in the dynamics of the microtubule and actin cytoskeletons at the onset of mitosis appear to occur independently recent evidence suggests that there may be crosstalk between the mitotic spindle and the actin cortex through GTPases. Matthews et al 2012. RHO family GTPases are activated by guanine nucleotide exchange factors (GEFs) in response to a plethora of extracellular stimuli regulating several cellular responses such as proliferation differentiation and movement. Among the numerous signaling events driven by RHO family GTPases are changes in cell morphology adhesion motility cell cycle progression survival apoptosis and cytokinesis. ARHGEF17 also called TEM4 tumor endothelial marker 4 a RHO family GEF specific for RHOA B C has been shown to regulate the interphase cytoskeleton. TEM4 has been shown to directly bind actin specifically dynamic newly assembled actin filaments via its N terminus independently of its RHOGEF activity. In interphase cells TEM4 and RHOC are proposed to suppress myosin contractility and to control focal adhesion disassembly. TEM4 has also been identified as an essential mitotic protein required for the localization of Monopolar Spindle 1 (MPS1) at the kinetochore. This thesis aims to understand the functions of TEM4 during the cell cycle. This study highlights the lack of specificity of the most commonly used commercial antibody against TEM4 and provides evidence that TEM4 plays a crucial role in mitotic entry chromosome alignment and spindle formation. The downregulation of TEM4 prevents cells from rounding up and alters cortical actin in mitotic cells leading to an increased activation of RHOA as shown by quantification of RHOA.

GTP at the mitotic cortex confirming its function as a regulator of cellular contractility The mitotic phenotypes observed in the absence of TEM4 are found to be partially due to low levels of Cyclin B explaining the observed mitotic delay The expression of exogenous Cyclin B restores cell cycle progression increases the mitotic index and rescues the excessively lagging chromosomes observed in the absence of TEM4 Overall despite the limited literature available on TEM4 this study sheds new light on the importance of TEM4 in the cell cycle and contributes to our understanding of this protein's role in cellular processes
