

MOON PHASES

The moon gets its light from the sun. Light reflects off the moon's surface and travels to Earth.

During a lunar eclipse, Earth passes between the sun and the moon, blocking the sun's light from reaching the moon.

The moon's illuminated side always faces Earth. This is because the moon rotates at the same rate it orbits Earth, a phenomenon called synchronous rotation.

The moon does not have a magnetic field, so it has no magnetosphere to protect it from the solar wind.

As the moon orbits Earth, the Earth's shadow can fall on the moon, causing a lunar eclipse.
