Physical Metallurgy of Refractory Metals and Alloys E. M. Savitskii, 2012-12-06 The principal reasons which induced the authors to write this book and the features of the book are set forth in the preface to the Russian edition That section of the science of metals which in Russian is called *metallovedenie* or the physical chemistry of metals is generally referred to in scientific and technical literature published in the English language by the term physical metallurgy These concepts are much broader than the term metallography used in the scientific and technical literature of various countries and applied solely to research on the interrelationships of the structure and proper ties of metals and alloys Each science must have its own subject and its own method of research Certainly all specialists will agree that metals and alloys including their solid solutions mechanical mix tures and metallic compounds form the subject of physical metallurgy or physical chemis try of metals The aim of this science is to produce a theory and to elucidate the experimental relationships which ought finally to make it possible to calculate quantitatively alloys Of given properties for any working conditions and parameters

Metallic Alloys Gilbert Henry Gulliver, 1913 *Polarity-Dependent Removal Interferences in Sink EDM of Titanium Alloys* Maximilian Holsten, 2018-12-31 In the design of turbomachinery components a significant effort is carried out regarding the optimization of efficiency The increase in thermal efficiency particularly involves the introduction of high performance alloys Such alloys are for example titanium alloys Sink electrical discharge machining sink EDM is a crucial manufacturing process for components due to its independence of machined material strengths however new materials require process design Hence research to understand and optimize the machining of titanium alloys is of great benefit to the industry in general A positive tool polarity is generally adopted in sink EDM to maximize material removal relative to tool wear Sink EDM of titanium alloys as Ti6Al4V is however atypical in that these materials necessitate a negative tool polarity Adding to the intrigue are gamma titanium aluminides TiAl which machine better under the conventional positive polarity Established explanatory models of sink EDM fail in resolving the removal behavior a need for fundamental research is given This thesis focuses on clarifying the phenomena behind this interesting behavior by investigating removal mechanisms over a range of relevant process conditions The polarity effect is demonstrated to arise from the polarity dependent nature and extent of titanium carbide TiC formation on the workpiece surface which significantly affects material removal mechanisms An explanatory model deduced from different experimental and numerical approaches clarifies the influence of polarity to the formation mechanism of a TiC layer With regard to monitoring of adverse layer formations the measurement of acoustic emission AE is proven an appropriate concept A correlation of the AE signal to process forces is even established which may be crucial to determine the deflection of thin electrodes in EDM Finally the knowledge acquired is applied and enhanced in

comprehensive process design that also involves the machining of additively manufactured TiAl The study reveals the beneficial behavior of the fine microstructure relative to the resulting surface integrity As a result this thesis delivers a model based concept for process design with respect to the adequate choice of tool polarity during machining of titanium alloys
