**Paleomagnetism of the Early Proterozoic Sioux Quartzite, Southwestern Minnesota--implications for Correlating Quartzites of the Baraboo Interval** Val W. Chandler, G. B. Morey, 1993 Paleomagnetic studies were conducted on the Early Proterozoic Sioux Quartzite one of the so called Baraboo interval red bed sequences of the Lake Superior region. A total of 158 samples were collected from 17 sites scattered across four basins: Cottonwood County, New Ulm, northern Pipestone, and southern Pipestone in southwestern Minnesota. Alternating field and thermal demagnetization studies indicate that the magnetization is dominantly single component and that the magnetic carrier is hematite. Hematite occurs both as a diagenetic mineral whose long paragenetic history began shortly after deposition and as veinlets that formed during a strain event possibly related to regional tilting. The magnetization is tentatively interpreted to have occurred before regional tilting although a definitive fold test is difficult because dips are low. Measured paleomagnetic directions at both site and basin levels show good clustering and the average directions obtained from each of the four basins are not significantly different at the 95 percent confidence level. The good clustering at all levels of sampling indicates that the Sioux Quartzite was magnetized either within a short time interval or during a period of subdued apparent polar wander. The structurally corrected paleomagnetic directions from the four basins yield a combined paleopole location at 1 01° W and 16° N,  $\alpha_{95} = 11^\circ$ . Dated paleopoles for Early Proterozoic rocks in North America and age dates of rocks interpreted to underlie the Sioux Quartzite imply that its age is 1 700 ± 1 650 Ma. This interval corresponds in part with the age of 1 800 ± 1 630 Ma of the Central Plains orogen which lies some 200–300 kilometers south of the Sioux Quartzite outcrop. Quartzite may reflect a tectonic pulse related to the Central Plains orogen. Preliminary paleomagnetic data on Baraboo interval quartzites from Wisconsin indicate that the Sioux paleopole cannot be distinguished at the 95 percent confidence level from that of the Barren Quartzite but that it differs from that of the Baraboo Quartzite which on the basis of existing apparent polar wander data could be as much as 100 million years older. The paleomagnetic data support previously raised cautions that some Baraboo interval quartz arenites may have been deposited in separate basins at significantly different times. *U.S. Geological Survey Bulletin*, 1983.

*U.S. Geological Survey Bulletin* Paul Kibler Sims, Richard W. Ojakangas, S. A. Nachatilo, S. R. Hemming, Theodore J. Bornhorst, Val W. Chandler, William J. Gregg, G. B. Morey, Gilbert N. Hanson, R. L. Bauer, Rodney C. Johnson, Warren C. Day, Scott M. McLennan, 1983 The Early Proterozoic Michigamme Formation of northern Michigan was deposited in the southeastern part of the Animikie basin. The formation conformably overlies the Goodrich Quartzite and comprises three widespread members: a lower member of thin bedded shale, siltstone and sandstone; the Bijiki Iron formation Member; and an upper member of turbiditic graywacke, siltstone and mudstone and a few local members. The Goodrich Quartzite is interpreted as having been deposited in a tidally influenced shallow marine environment. The lower member of the Michigamme is interpreted as having been deposited in a tidally influenced environment; the iron formation member as

having been deposited below wave base in somewhat deeper water and the upper member as having been deposited in still deeper water with turbidity currents being a major depositional mechanism Several lines of evidence including paleocurrents paleo geographic setting and neodymium isotopes suggest that the graywacke of the southern part of the outcrop area was derived from the south Early Proterozoic Wisconsin magmatic terranes Archean miniplates and older Early Proterozoic sedimentary units formed on the continental margin and that the graywacke in the northern area was derived from an Archean terrane to the north The tectonic model that best fits the available data is a northward migrating foreland basin
