

1 Background

Orthologs are genes in different species derived from the last common ancestor through speciation events. Orthologous genes generally share the same biological functions in their host genomes. Therefore, identification of orthologous genes among a group of genomes is crucial to almost any comparative genomic analysis (Alexeyenko et al.). In contrast, paralogs, which are genes that are resulted from gene duplication within a species, may have different functions, though their sequences can be highly conserved. Depending on whether duplication occurred before or after speciation, they are called outparalogs or inparalogs, respectively (Sonnhammer and Koonin). Thus, a major challenge in predicting orthologs of a gene is differentiating its orthologs from the orthologs of its paralogs.

Furthermore, due to the rapid advancement in sequencing technologies, sequencing a prokaryotic genome now occurs at an unprecedentedly fast speed and low cost. As a result, tens of thousands of prokaryotic genomes have been fully sequenced, and this number will soon reach hundreds of thousands. The availability of a large number of completed genomes makes comparative genomics an increasingly powerful approach for genome annotations, thereby addressing many important theoretical and application-based problems. However, the rate at which genomes are sequenced outpaces that at which CPU speed increases. This poses a great challenge in comparative genomics that requires faster algorithms or adaptation of existing tools in parallel environments.

OrthoMCL (Li, Stoeckert, and Roos) is one of the most widely used algorithms for predicting orthologous genes across multiple genomes. Similar to many other orthology prediction algorithms (Gabaldón and Koonin Kuzniar et al.), OrthoMCL is based on reciprocal

21st Century Sociology: A Reference Handbook Clifton D. Bryant,Dennis L. Peck,2007 Publisher Description

Sociology and Scientism Robert C. Bannister,2014-02-01 During the 1920s a new generation of American sociologists tried to make their discipline more objective by adopting the methodology of the natural sciences Robert Bannister provides the first comprehensive account of the emergence of this objectivism within the matrix of the evolutionism of Lester Ward and other founders of American sociology Objectivism meant confining inquiry to the observable externals of social behavior and quantifying the results Although objectivism was a marked departure from the theoretical and reformist sociology of the prewar years and caused often fierce intergenerational struggle sociological objectivism had roots deep in prewar sociology Objectivism first surfaced in the work of sociology s second generation the most prominent members of which completed their graduate work prior to World War I It gradually took shape in what may be termed realist

and nominalist variants the first represented by Luther Lee Bernard and the second by William F Ogburn and F Stuart Chapin For Bernard a scientific sociology was radical prescribing absolute standards for social policy For Ogburn and Chapin it was essentially statistical and advisory in the sense that experts would concern themselves exclusively with means rather than ends Although the objectivists differed among themselves they together precipitated battles within the American Sociological Society during the 1930s that challenged the monopoly of the Chicago School paving the way for the informal alliance of Parsonian theorists and a new generation of quantifiers that dominated the profession throughout the 1950s By shedding new light on the careers of Ward and the other founders and by providing original accounts of the careers of the leading objectivists Bannister presents a unique look at the course of sociology before and after World War I He puts theory formation in an institutional ideological and biographical setting and thus offers an unparalleled look at the formation of a modern academic profession
