01.00 *Introduction to HVAC*

Heating Ventilation and Air Conditioning [HVAC], as the name suggest is a vast concept and that part of science dealing with the state of medium or matter which is disturbed by means of external aid to change the physical properties of matter like temperature, pressure, flow velocity, humidity and specific volume.

Heating – is a concept of raising the temperature of the matter to the desired limits with or without change in its pressure and volume.

Ventilation – is a system of revival of conditions of air in a confined space for human comfort or process requirements.

Air conditioning and refrigeration – is a system of cooling of air, dehumidification of air, humidification of air, cooling of other matter for process requirements.

01.01 *Ventilation*

A ventilation system, generally would mean intake or distribution of air either by dilution methods or exhaust methods to meet the following objectives –

(a) To provide oxygen: The oxygen concentration is 21 % by volume in atmospheric air. It should not be allowed to fall below 15% under any circumstances whatsoever. The metabolic oxygen requirement of individuals varies between 0.03 m³/hr for very light work to 0.15 m³/hr for very heavy work.

(b) To remove carbon dioxide: The CO₂ concentration in atmospheric air is 0.03% by volume. It should not be allowed to rise above 5% under any circumstance. For CO₂ dilution, a minimum fresh air flow of 0.2 cmm per adult is recommended. In spaces of heavy activity and smoking, 0.7 to 1.1 cmm per person is required. 0.42 cmm of fresh air per person is used as a design standard.

(c) To remove odours: Normally, 0.42 cmm of fresh air per person is required to remove body odours. The actual air requirement depends on room size and level of activity.

(d) To remove heat and humidity: Removal of body heat and moisture addition by ventilation is the controlling factor. If this is accomplished, all other requirements will be met. For adults, the body heat generation is taken as 116 Watts per person.

(e) To dilute toxicity: This is required when toxic and hazardous fumes/particles are being generated in the space. A very detailed study is required for such purpose. However, the dilution ventilation is not very effective. In such cases, an outright removal by exhaust ventilation is recommended.

A dilution ventilation system partially or wholly recycles the same air with a known quantity of fresh air, generally at 1 Air changes per hour.

An exhaust ventilation or Once Thru ventilation draws fresh air and exhausts the air in the room in suitable means of outlet air conditioners.

** "cmm": cubic meter per minute: a unit of air displacement.
