Source Code Optimization Techniques for Data Flow Dominated Embedded Software Heiko Falk, Peter Marwedel, 2013-03-19 This book focuses on source to source code transformations that remove addressing related overhead present in most multimedia or signal processing application programs This approach is complementary to existing compiler technology What is particularly attractive about the transformation flow presented here is that its behavior is nearly independent of the target processor platform and the underlying compiler Hence the different source code transformations developed here lead to impressive performance improvements on most existing processor architecture styles ranging from RISCs like ARM7 or MIPS over Superscalars like Intel Pentium PowerPC DEC Alpha Sun and HP to VLIW DSPs like TI C6x and Philips TriMedia The source code did not have to be modified between processors to obtain these results Apart from the performance improvements the estimated energy is also significantly reduced for a given application run These results were not obtained for academic codes but for realistic and representative applications all selected from the multimedia domain That shows the industrial relevance and importance of this research At the same time the scientific novelty and quality of the contributions have led to several excellent papers that have been published in internationally renowned conferences like e.g. DATE This book is hence of interest for academic researchers both because of the overall description of the methodology and related work context and for the detailed descriptions of the compilation techniques and algorithms
